- 5. EFFECTIVE ON TREE STUMPS**—Spraying basal spray on tree stumps eliminates almost all suckering or resprouting next spring.
- 6. USE REGULAR WEED EQUIPMENT**—Basal spraying does not involve special equipment. Use regular crop sprayer or knapsack sprayer.

**Remember:** No matter when you kill brush — spring, summer, fall, or winter—Weedone Brush Killer 32 is the ideal spray. It contains the powerful, low-volatile butoxy ethanol ester of 2,4-D and 2,4,5-T, the two most effective killers for woody plants. Get Weedone Brush Killer 32 from your dealer. Put it to work on your farm now—and all winter long.

## FARMERS OPPOSE MANY PMA POLICIES

**D**URING the past several months your AMERICAN AGRICULTURIST editors have been trying to find out what farmers think about the work and policies of the Production and Marketing Administration (PMA). We have visited with farmers all over the Northeast, had many letters from them, and more recently have had reports of the "family farm policy" meetings held by the U. S. Department of Agriculture in the Northeast and across the nation for a so-called "farm opinion survey."

A large number of farmers are opposed to many of the PMA policies. They believe there is little grass roots control of the policies; that instead the policies are dictated from Washington. They think that some of the activities are unnecessary or duplicate those of farmer-controlled organizations, and there is a feeling that one purpose back of the PMA is to get control of agriculture away from the farmer's own organizations.

Many farmers are sure that there are altogether too many public agricultural employees, and that this large number could well be reduced, to the benefit of agriculture and the taxpayer.

There is strong support on the part of the farmers for good soil conservation practices, for the Farm Credit agencies, and, of course, for the Farm Bureaus, all extension forces, and especially for more and more research to solve agricultural production and marketing problems.

Although there are many exceptions, a majority of farmers are opposed to continuing PMA payments for superphosphate or lime, or for any other government "give-aways."

It is recognized and conceded that some PMA activities like handling crop surpluses and helping the school lunch program, and especially the marketing agreements, are good, but the generally poor attendance at the recent so-called "family farm policy" meetings, the embarrassing questions asked at these meetings by the actual farmers present, and the many reports we have received, indicate that farmers in general are becoming well aware of the problem of too much government in their business.

## CAN YOU TELL WHY?

**M**Y brother Albert, who is the only other member left out of my father's family, has been paying me a visit, and we have been talking over all the old and the new problems. One warm evening recently as he and I sat on the porch watching the stream of cars go racing past, he said, suddenly:

"Why, the American people are rich. Even poor people have a car. No other people in any country or in any other time have the things that almost every American has. Why is it, then, Ed," he continued, "that there are so many communists, socialists and do-gooders who want to change our form of government, our way of life, and throw away all the blessings of liberty?"

I had no answer for that question. Have you?

## WOMAN SUFFRAGE AGAIN

**I**F THE statements in the first part of "Wanted, Your Opinion," by our Home Editor, on Page 26, aren't just like a woman, I'll eat my old last year's hat! I never said that women weren't doing just as good a citizenship job as men. Of course, neither men nor women are doing too good a citizenship job.

What I did say in two editorials in recent issues on woman suffrage was that women are doing no

*By E. R. Eastman*

better than men in citizenship responsibilities, and that we men expected a better job from them when they finally got the vote. The whole purpose of my editorials on the subject of woman suffrage is to get you gals mad enough to show us men that you can clean house with the rascals in government and help to improve the whole government service, and that you can make your vote and your influence really count.

Of course, there are many splendid women's organizations, and thousands of individual women doing great leadership jobs for their communities, their states and their nation. My point is that none of us is doing enough, and that includes the women as well as the men. And I'll add that unless all of us do more, we can soon kiss our liberties goodbye!

## THE LEAN HORSE TO THE LONG RACE

**T**HREE of my friends who were overweight have cut down their weights from 20 to 25 pounds within the past year. Getting rid of the surplus baggage has made a wonderful change in their personal appearance, greatly improved their general health, and lengthened their chances for living a long and healthy life.

I convinced one of these friends that he ought to reduce by reminding him that every time he went upstairs—every time he went anywhere—he was carrying the equivalent of from 10 to 15 pounds weight in each hand, and that weight was not only slowing him up but was a very dangerous burden on his heart.

The rule followed by these friends who have reduced is very simple. **THEY ATE LESS**, but they were careful to keep a balanced diet. They cut down on their intake of carbohydrates, including especially rich desserts and sweets. They ate less fat, and they balanced their diet by fruits, vegetables and plenty of milk. Personally, I drink two quarts of milk every day from which most of the cream has been removed. I have learned to like it that way, and you could, too.

If you are overweight you had better think about it, but don't reduce too rapidly, and talk the matter over with your doctor. If you are over thirty years of age, and especially if you are not doing heavy physical work, it is almost certain that you are eating more than you need.

## A PESKY WEED

**T**HE LAND on my farm will grow any crop and grow it well, including wild morning glory, which is just about the worst weed that we contend with. In spite of everything we can do, it chokes off a raspberry patch in two or three years, it climbs to the top of the cornstalks—it is everywhere.

One reader says that if there is some way that you can pasture off wild morning glory, cows will eat it and like it, and it won't grow again in two or three years.

If wild morning glory bothers you, how do you control it?

## BEST BUY

**G**EORGE SERVISS, G.L.F. crop specialist, emphasizes the fact that limestone is the best buy among the major crop production supplies which farmers buy. "The pre-war dollar," says George, "is still worth about 80 cents when it comes to purchasing this commodity. The returns in the use of needed limestone are also high, usually around \$5 to \$10 in extra crop value for each dollar invested in lime."

It can be added that much of our northeastern farm country still needs more lime than it is getting.

## OUR FINE SHADE TREES ARE DYING OFF

**A**ROUND our farmhouse and on the bank overlooking the highway are several fine big maple trees. Unfortunately, they are old and in a few years will all be gone. Over the weekend we had to cut down two of them because they were becoming a danger. The grand old elms of our countryside are disappearing also.

Why not resolve to plant at least one or two trees around your homestead every year? But if you do remember to keep them far enough apart, and not so close to buildings that they furnish too much shade when grown.

## LET'S RENAME THE BABY

**M**Y friend, J. M. Beiermeister, Manager of the Van Horne Farms, Inc., at Van Hornesville, New York, says that it is most unfortunate that we got started with the name of "pen stabling." Jim says: "The name 'pen stabling' makes everyone, including the Health Department, think of pig pen, which is a byword that has come down through the last several generations."

He says that the name should be "loose housing," "comfort housing," or perhaps some title with freedom in it, meaning freedom from disease or freedom from close proximity to dirty gutters.

We of AMERICAN AGRICULTURIST agree with Jimmy, and we are coming to you dairymen for suggestions of a name that would cover this type of stabling cows and that would be acceptable to everyone. The suggested name must be accompanied by a letter explaining why you chose the name.

For the best name and letter, AMERICAN AGRICULTURIST will pay \$15. The decision will be made on the quality of both the name and the letter, and the editorial staff of AMERICAN AGRICULTURIST will act as judges. Letters should be in the Editorial Office of AMERICAN AGRICULTURIST, Savings Bank Building, Ithaca, N. Y., not later than November 1.

## PONDER THESE FACTS

**I**F EVERY person in the United States cashed in all of his life insurance policies, the total would amount to 45 billion dollars. This would not be enough to run our national government for 8 months.

If every city home owner in this country sold his home, the total would amount to 30 billion dollars. This is not enough to run the government for 6 months.

If every farmer in this country sold his farm, farm equipment, and livestock, the total would amount to 25 billion dollars. The national government could not run for 5 months on that amount of money.

It should be evident to everyone that this government extravagance cannot continue without ruin to all of us.

## EASTMAN'S CHESTNUT

**M**R. ARTHUR L. COOK of East Freetown, New York, says that he has just recently received a letter from a friend in the West whom he visited a few years ago. The letter reads as follows:

"Dear Friend: I thought I would write and tell you about some changes since you were here. You remember when you were here we were living in a one-room shack out on the ranch. The next year we struck oil, so we sold out and got a lot of money and bought a great big house in town that has six rooms in it. One room just to eat in, another room to sleep in, another one to cook and bake in, another one all painted white. In one corner it has a big tub to wash all over in. In the other corner is a small tub to wash your feet in. It had two covers on it, but they were in the way, so we took them off. One we use for a bread board, and the other made a good frame for granddad's picture."

# AA's Farmers' Dollar Guide

**PRICE TRENDS:** Economists seem far less certain than they were a few months ago that inflation will continue. As always, individual opinions vary all the way from those who predict continued inflation to those who expect ruinous deflation. Of one thing you can be sure: if we get any considerable downward trend in prices, government agencies will use every effort to halt the trend. Much has been said by government spokesmen about the dangers of inflation but they rightly fear deflation much more than they do inflation.

Prices of farm products have trended downward for several months, therefore, the farmer who bases all his plans on expected higher prices is flirting with trouble.

While early frost still poses some danger to corn in certain areas, it looks as though the feed supply would be adequate and that feed prices will stay in line with price trends. Therefore, it is possible that the man who buys feed heavily in advance could lose money.

**SELL OR STORE?:** If, as more and more economists seem to expect, prices level out or perhaps even drop, you are taking a long chance to hold farm products hoping for better prices as a result of inflation. If you hold, it should be on the basis of the supply and demand of the crop in question. For example, apple marketing experts agree that a good proportion of the crop needs to be sold before first of the year. On the other hand, farmers have reduced potato acreage to the point where the estimated yield about equals the potato consumption last year. Some private estimates indicate potato crop will be less than the latest government report. If you have adequate storage, it looks like a good gamble to hold part of your potatoes until spring.

**FARM CHEMICALS:** Few of us realize the increasing importance of chemicals on farms. In 1933, production of agricultural chemicals totalled 150 million pounds. This year, annual figure is around a billion pounds. Figure includes chemicals for fertilizers, insecticides, fungicides, weed killers, hormones for "stick-on" apple sprays, rat killers, livestock remedies. Chemicals are also important for war. For example, sulfuric acid is used for explosives and also for fertilizers.

The situation here is different than on feed, and it would seem wise to anticipate needs and get delivery early. Same applies on farm machinery, where military demands are to be met first and industry and agriculture take what's left.

**1952 ACREAGE:** In spite of reports of possible shortages in machinery and supplies, USDA is expected to ask for 1952 acreage increases of certain crops compared to 1951. If prices of farm products continue to slant downward, farmers are unlikely to respond to such requests. Under such conditions the demand for fertilizer might decrease compared to '51.

If this should happen, USDA will probably try to boost prices to encourage farmers to plant. It is confusing, to say the least, to have government agencies talk about price controls and price supports in practically the same breath.

**DAIRY:** Present price relationships would indicate the wisdom of keeping the barn full of high producing cows. The cost of labor, feed and supplies also encourages selling all cows that are not satisfactory producers. Furthermore, be sure you are getting the going price for any animal sold for meat. I am told that in some areas, dealers buy cull cows and that same week take them to a nearby auction and get prices which net them a very handsome profit, all because the owner does not know what they are worth in the open market.

**DEFEATISM:** Too many citizens believe economy in government is impossible. Some point out that after all domestic government expenses are a very small part of the total budget. Others feel costs could be cut, but throw up their hands and say, "What can we do?"

What can you do? Tell your congressman. But don't ask that the other fellow take ALL the cuts.—Hugh Cosline

## The Song of the Lazy Farmer

plan to come home sooner if I can." You'd think, at least, she'd ask me how my rheumatiz is feelin' now; well, I'll write back that all's okay, and maybe she'll decide to stay.

MIRANDY'S gone a-visitin', she's checking on her city kin; she wants to meet the new in-laws, she thinks that she can find the cause why Uncle Louie left his wife, she'll have the best time of her life a-chuckin' babies 'neath the chin; and then she's bound to start right in to tell each mamma what to do when junior starts to fret and stew. She'll turn her personality on ev'ryone that she can see; "Why, Susan!" she'll say, "you've got thin!" and Uncle George will start to grin when he is told he's handsomer than Peck or Gable ever were.

But that same personality don't show much when she writes to me. Today's note, for example, had just four lines, all of which sound mad. "I'll bet," it started out, "that you have not found time as yet to do one thing that's on the list you've got, and I imagine, like as not you're spending all your time in town a-chinnin' with that jerk, Joe Brown!" And then she adds, "I'd better

# don't let winter rust catch you napping

When it's lay-up time for your farm machinery don't *you* be caught napping! RIGHT NOW is the time to give your equipment complete all-winter protection.

Let Esso Rust-Ban products give the proper kind of protection to your valuable machinery NOW for longer life and bigger profits!

**ESSO RUST-BAN 347** is easily, quickly applied with a rag swab or old brush to plows, cultivators, discs and other implements. This protective coating guards against rust and adds years of usefulness to hard-to-get farm machinery.

**ESSO RUST-BAN 603** resists rust formation on inside of idle engines by forming a lasting film. Rust-Ban 603 gives dependable, all-winter, protective coating to cylinders, pistons and other inner precision parts. For best results follow directions when using.

Your **ESSO FARM DISTRIBUTOR** has a complete line of dependable Esso Farm Products—Esso Extra Motor Oil, Essolube HD, Esso Tractor Fuel, Esso Extra Gasoline—to help you get performance plus from your tractor, truck, and other machinery.

## Name Livestock Champions at New York State Fair

**B**IG classes, expert judging and excellent showmanship marked the greatest livestock show ever presented at New York State Fair in Syracuse, September 1 to 8.

In the following list of results in the various breeds of cows, sheep and swine, all addresses are New York State except where otherwise indicated.

### Cattle

#### JERSEY

**Bulls:** Grand and Senior Champion—Advancer Star Designer—Harmony Jersey Farms, Greenwich, Conn. Reserve Grand Champion—Homeland Jester Boy Andy—Pioneer Farms, Old Lyme, Conn. Junior Champion—Chief's Advancer Dandy Zinnias—Ideal Farm, Vestal.

**Females:** Grand and Senior Champion—Rosemary Rush Starlet—Harmony Jersey Farms. Reserve Grand Champion—Advancer Star of S.S.F.—Silver Springs Farm, Syracuse, Jr. Champion—Double Design Noble Jolly—Harmony Jersey Farm.

**District Herds:** 1. Central New York Club, Syracuse; 2. Delaware County Herd, Hobart; 3. Capitol District Jersey Club, Greene.

#### BROWN SWISS

**Bulls:** Grand and Senior Champion—Judd's Pledge Baron—Mt. Auburn Farms. Auburn. Reserve and Jr. Champion—Walhalla Gentleman Whirl—Cornell University.

**Females:** Grand and Senior Champion—Nancy Bobette—L. G. and J. L. Boyd, Canandaigua. Re-

Melvin Lampkin Jr., of RD 1, Amsterdam, N. Y., holds his Brown Swiss calf, Walhalla La Maybell. Melvin won first prize in fitting and showmanship in the Junior 4-H Class at the New York State Fair.

serve Grand Champion—Alexander's Sue—James Alexander, Scottsville. Jr. Champion—Riverside Ranch Dollie—Peter Klotzbach, Jr. and Son, Corfu.

**District Herds:** 1. Western N. Y. Canton herd; 2. Central N. Y. Canton herd, Syracuse, N. Y.; 3. Northern N. Y. Canton herd, Massena.

#### GUERNSEY

**Bulls:** Grand and Senior Champion—McDonald Farms Ideal Mars—Clarence Marsh, Canandaigua. Reserve Grand Champion—McDonald Farms Steadfast Odin—McDonald Farms, Cortland. Jr. Champion—Nodrog Melba's King—Whitehall Farm, Brockport.

**Females:** Grand and Senior Champion—McDonald Farms D. Monogire. Reserve Grand Champion—McDonald Farms Ideal Nora. Jr. Champion—McDonald Farms LePretty Lady.

**District Herds:** 1. Finger Lakes District Guernsey Breeders' Association—Cortland; 2. Wayne County Guernsey Club—Ontario; 3. Dutchess County Guernsey Breeders' Association—Millbrook.

#### AYRSHIRE

**Bulls:** Grand and Senior Champion—Sunny Acres True Design—S. N. Stimson, Spencer. Reserve and Jr. Champion—Marie Lass King of C.B.—Abigail Ann Stimson, Spencer.

**Females:** Grand and Senior Champion—Melody Lane Hope—Fred J. Bolva, Burke. Reserve Grand Champion—Woodford Fortunate Dolphin and Jr. Champion—Meredith Barrart—Meredith Farms, Topsville, Mass.

**District Herds:** 1. Clinton, Franklin, Essex Ayrshire Club—Ellenburg; 2. Tioga County Ayrshire Club, Spencer; 3. Ontario County Ayrshire Club, Canandaigua.

#### HOLSTEIN-FRIESIAN

**Bulls:** Grand and Senior Champion—Smithland Supreme Champion—Forsgate Farms, Jamesburg, N. J. Reserve Grand Champion—Illchee Supreme Sovereign—Jane Robens, Poland. Jr. Champion—Franlo Chip Squire—Elmer Marshfield, Marcellus.

**Females:** Grand and Senior Champion—Harden Farms King Ina—Harden Farms, Camden. Reserve Grand Champion—Cornell Pledge Colie—Cornell University. Jr. Champion—Smithland Supreme Mollene—Forsgate Farms.

**District Herds:** District and County Holstein Clubs were rated in this order: Oneida, Chautauqua, Eastern New York, Franklin, Cayuga-Seneca, Livingston, Finger Lakes, Onondaga, Otsego-Herkimer, Montgomery, Wyoming, Schoharie, St. Lawrence, Wayne-Ontario, Cortland and Madison.

#### MILKING SHORTHORN

**Bulls:** Grand and Senior Champion—Barrington Wildeyes—Grassy Lane Farm, Cazenovia. Reserve and Jr. Champion—Grassy Lane Goldmint—Grassy Lane Farm.

**Females:** Grand and Senior Champion—Barrington Bright Queen QM—Grassy Lane Farms. Reserve Grand Champion—Last Chance Bell Van Berg—Last Chance Ranch, Lake Placid.

#### HEREFORD

**Bulls:** Champion—Bean Zenith 46th—F. F. McIntosh and Son, Spencer, W. Va. Reserve Champion—Powisset Baca Duke—Powisset Farm, Dover, Mass.

**Females:** Champion—Mission Miss 3rd F. F. McIntosh and Son. Reserve Champion—Miss S. F. G. Royal M. 71st—F. F. McIntosh and Son.

**New York Special** (best two head, any age, either sex, from above classes, bred and owned by New York State exhibit-

ors): 1. Cornell University; 2. Holcomb Hereford Farm, Holcomb; 3. Earl M. Welcher and Sons, Newark; 4. Gerald A. Orbaker, Williamson; 5. Highlawn Farm, North Rose; 6. Rob-Lyn Farm, Canandaigua; 7. Anchorage Farms, Cobleskill.

**Steers:** Champion—Powisset 141st—Powisset Farm.

#### ABERDEEN-ANGUS

**Bulls:** Grand and Senior Champion—Bent Lee Master Mercury—Bent Lee Farm, Brant Lake. Jr. and Reserve Grand Champion—Prince Runnymede 59th—Cochran Farm, North Salem. Reserve Senior Champion—Ankonian 3216—Cochran Farm. Reserve Jr. Champion—Rally Black Prince 4th—Rally Farm, Millbrook.

**Females:** Grand and Jr. Champion—Rally Blackcap 43rd—Rally Farms. Reserve Grand and Reserve Jr. Champion—Globe Hill Barbara 22nd—Fuerst Stock Farm, Pine Plains.

**Steers:** Champion—Fritz—Ess Kay Farm, East Aurora.

### Sheep

#### CORRIEDALE

All champions exhibited by Woodbine Farms, Gambier, Ohio.

#### COLUMBIA SHOW

All champions exhibited by Leonard Sipperly and Son, Tuscarora.

#### KARAKUL SHOW

Champion ram and Champion ewe, Karakul Fur Farm, Fayetteville. Reserve Champion ram, R. L. Harris, Fabius. Reserve Champion ewe, Leo R. McCarthy, Syracuse.

#### HAMPSHIRE

Champion ram and Reserve Champion ewe, Charles Smith, Skowhegan, Maine. Champion ewe, James McGuire, Oakfield. Reserve Champion ram, Cornell University.

#### SUFFOLK

Champion ram, Hob and Nob Farm, Frankestown, N. H. Reserve Champion

# THE BIG BARGAIN in Farm Power and Utility....

CASE  
MODEL "VAC"  
TRACTOR

**A HANDY TRACTOR  
FOR A HUNDRED JOBS**

## GET A DEMONSTRATION

There's no tractor that can help you so much with so many farm jobs as the improved Case "VAC." Besides all your regular field work you can pull posts, dig postholes and stretch fence . . . latch onto hammer mill and go grinding . . . carry feed to cows and bring back milk—all with no heavy lifting. You can load manure, scald hogs; saw trees down and cut logs up. You can clear away snow, grade a road, dig a pond. Try the new short turning of the "VAC," and its extra easy steering. Notice its added clearance, extra traction. Let your Case dealer demonstrate now.

**Pivot-point turning—faster, easier steering.** New steering gear swings front wheels all the way for pivot turn on one rear wheel. Roller bearings on swivel post make steering amazingly easy. Six steps of adjustment take up wear, keep steering snug.

**New easy riding—better braking.** Shock-absorber seat mounting (extra) smooths out the jolting and bouncing from rough ground and cross rows. New shoe-type brakes aid turning, hold equally well ahead or back. They are dust-tight, adjustable from outside.

**Bigger wheels, better traction, more crop clearance.** Higher wheels raise axle two inches, let you cultivate taller crops. Big tires slip less, last longer, pull stronger—especially in soft soil or snow, or when crossing ridges, furrows and field ditches.

**Exclusive Eagle Hitch—Latch-On Implements.** Only Case offers Eagle Hitch that hooks up Latch-On Implements in one minute, pulls plows at even depth in uneven ground. Complete Latch-On line includes brand-new break-away plow for stony, stumpy land.

## 25 GREAT CASE TRACTORS

Your Case dealer offers the right size and type of tractor to fit your acreage and crop system. Besides the low-cost 2-plow "VA" Series there are the bigger 2-plow "S" Series, fast 3-plow "D" Series, and the mighty 4-5 plow Model "LA." There are all-purpose models with twin or single front wheels, or adjustable front axles, also orchard, high-clearance, and stand-ard 4-wheel models. "D" Series and "LA" can be ordered for LPG fuels.

# NEW NATIONAL Record made on BEACON FEEDS

**C**ONGRATULATIONS to Daniel I. Mayne, Knollwood Farms, Fairport, New York, owner of Knollwood Rag Apple Nettie, who produced 1,273.2 lbs. butterfat, 26,510 lbs. milk. This is the highest butterfat record ever made in the United States on 3x milking. To Knollwood Farms and "Chet" Benschneider, herdsman, belong the credit for good breeding, management and feeding. To Beacon goes the credit for high production feeds used in making the record.

Knollwood Rag Apple Nettie, like thousands of other high producers, was fed on Beacon "18" Test Cow Ration which is designed for the severe demands of high producing cows. She was grown on the Beacon Calf Starter Program and fitted on the Beacon Dry Cow Program.

#### 13 National Records on Beacon

This is the thirteenth National Record made by Beacon-fed cows. Substantial evidence—we think—of the high productive capacity of Beacon Feeds.

See your nearest Beacon dealer for latest bulletins on our feeds, which are distributed from Maine to Virginia and West Virginia, exclusive of Western Pennsylvania and Western New York.

Box 528 A Inc. Ithaca, N. Y.

# Feeding Cows When They Are **DRY**

By **NICHOLAS FRANK**

**T**HE MOST important factor in getting high production in our herd is the care during the dry period. That includes the proper length of dry period which varies in our herd from 6 to 8 weeks. Also good liberal grain feeding during that time.

Our results from feeding individual cows are quite varied, but one case has always seemed quite important to me. Our "twin" cow was dry only 5 days. When it came time to dry her off, we reduced the feed to practically nothing and started milking her once a day. Every time we tried to skip more milkings, mastitis would set in in one or more quarters. After starving her for two weeks with no grain and only poor pasture, her production would not drop below 15-20 lbs. daily. So, one night I told Dad we had better put her on a full feeding of fitting ration, which consisted of 15-16 lbs. daily, and continue to milk her twice daily. That we did.

#### It Pays Off

About a week before she freshened, her production dropped sharply, and 5 days before freshening we discontinued milking. Previous to that she had completed two DHIA records of 410 and 413 lbs fat and averaged over 12,500 lbs. milk. During the lactation that followed, she produced 11,720 lbs. milk and 384 lbs. fat in 10 months. She is fresh again after being dry the regulation length of time and is doing fine, the best ever, except for repeated attacks of mastitis which I believe to be caused by insufficient feeding during the dry period I have described.

The particular feeding problems I have had and how I have met them have resulted in quite a set of rules. I was troubled by how much to feed before freshening. We now feed heifers that are freshening for the first time 12 lbs. of fitting ration for 2 months before freshening.

We feed 16 lbs. of fitting ration daily to all cows that have freshened at least once as soon as they are completely dry and will handle that amount. We don't have much trouble getting them to eat it. Some high producing cows that have reached maturity (5 years) will be fed higher according to their appetites and previous production, in order to build their bodies to maintain their production at a high level.

#### Feed 1 To 3 Ratio

After freshening we feed at a 1:3 ratio as soon as the cow will handle feed in that amount. We feed all fitting ration until the udder is completely free of congestion. Then we slowly change to a dairy ration, changing about 4 lbs. of her grain per week. If a cow gains on her milk production, warranting more feed, she first receives it in the form of fitting ration.

We feed no silage at all. Dad had a silo, but having such wet ground, he could not depend on a crop to fill it. We feed hay and grain in the winter, the hay being replaced by pasture and green oats or millet in the summer. During the winter months we feed a

dry and freshening ration containing 400 lbs. molasses per ton. It tends to keep the cows loose and regulated. Our production appears to drop when molasses is not included, and some cows recently fresh, contract acetoneemia (lack of sugar). We have had two. Loss of production is the result.

We have been using a mineral supplement for nearly four years. Since using it, we have less freshening

Nicholas Frank stresses the practice of fast clean machine milking with no hand milking. He has milked as high as 27 cows in 40 minutes with three machines. "Milking at regular intervals really pays off," he says.

troubles. Our breeding troubles have all but disappeared, our conception rate has run 90% or higher on first service the past two years. The cows appear slicker and shed their hair earlier and easier. Our young cattle have really shown a great improvement over years past. Thrifty young cattle play a very important part in maintaining a high producing herd, as we raise all our replacements.

The manner in which feeding affects the health of our herd is very pleasing to me. While feeding heavier the past two years than ever before, there is no sign of ill effects on the animals due to feeding. Our breeding, calving, and production efficiency has risen far above the average we had when we started DHIA testing.

#### DHIA Is Gold

Other experiences that I feel are important in getting top production in our herd boil down to DHIA testing. It's worth its weight in gold. It uncovers your high and low producers; allows better selection of calves to raise for herd replacements; shows herd sires to be what they are; and makes culling the inefficient cows from our dairy casier. It has made possible an average gain in our herd of 4,833 lbs. milk and 163 lbs. fat per cow.

The first year we tested in DHIA, we averaged 7,576 lbs. milk and 268 lbs. fat on 32 cows. We have just finished our fourth year of testing with an average of 12,490 lbs. milk and 431 lbs. fat on 28 cows. The 10-year herd summary in our herd book shows we have 4 less cows than when we started

(Continued on Page 29)

# **PROVE/TO YOURSELF...**

# **You can do more work with a McCormick Farmall®**

## **You can do so much work—with so little fuel!**

Make the gallon-of-gas test with the two-plow, two-row Farmall Super C tractor. Sock the plow down *deep* into the toughest plowing! *Prove to yourself* how much farther a Farmall Super C runs on a gallon of gasoline—how much *more* work you can do—than with other similar-size tractors.

## **You can feel the positive pull-power**

Try the Farmall Super C on heavy drawbar work. Feel the *sure* traction, the *extra* pull-power as the big, 54-inch-high tires take hold. See the *clean, slip-free* tracks of the tire cleats. Notice, too, how the big-diameter steering wheel, double-disc brakes and swinging drawbar permit you to make smooth, easy turns in soft ground.

## **You Can Cultivate High Crops**

Look at the ample clearance under *both* tractor and cultivator with a McCormick Farmall. You can cultivate later in the season as crops grow taller. There's 23 $\frac{3}{8}$ -inch clearance with the Super C; 21 $\frac{1}{8}$  with the Super A; 19 $\frac{5}{8}$  with the Cub. You can side-dress with the same fertilizer unit that works with the matching planter.

## **You Enjoy All-Day Driving Comfort**

Slip into the driver's seat of a Farmall. Take the wheel—see how easily the tractor handles. Feel how the seat absorbs the bumps and jolts . . . all day long. Notice how handy the controls are—from hydraulic Touch-Control levers to the conveniently located brake and clutch pedals. All controls are designed with *your* comfort in mind.

**PROVE/TO  
YOURSELF...**

YES . . . prove to yourself that you can farm better . . . that you can **PRODUCE MORE** . . . with a McCormick Farmall tractor and your choice of a full line of McCormick implements. See your International Harvester dealer today for a "prove-to-yourself" demonstration.

# This baler can wire-tie 100 tons a day!

**As many as four 100-pound bales per minute—  
safely tied—and only one tie per strand.**

● The New Holland "80" gives you up to twice the capacity of other wire-tie balers now on the market—up to 10 tons per hour! Imagine the savings possible for you now that one man can wire-tie so much hay in so short a time.

Not just a conversion of the famous "77" twine-tie, the Model "80" was designed from the ground up as a wire-tie baler. Its tying mechanism is fast and trouble-free.

The "knot" is tied in an "inline twist"—won't pull loose or uncoil. Baling action is designed to save the valuable leaves. This means up to 50% more feed value . . . a better price for hay.

If you're looking for a wire-tie, remember, the New Holland "80" gives you up to 10 tons an hour! New Holland Machine Co., New Holland, Pa. A Subsidiary of The Sperry Corporation.

## UP TO TWICE THE CAPACITY OF OTHER WIRE-TIE BALERS PLUS THESE EXCLUSIVES!

**Warning System**  
When wire in the cans runs low, an automatic warning lets you know in time to prevent missing any bales.

**"Wet" or Dry Hay**  
Hydraulic bale tension control, an optional feature, automatically allows for variations in moisture content.

**New Holland Twist**  
The Model "80" ties its "knot" in an "inline twist." This wire-tie lies flat—will not pull loose or uncoil.

**Roll-Away Bale Chute**  
Standard feature on the wire-tie "80", the roll-away bale chute flips bales far out of the tractor's path.

**If you prefer a twine-tie baler,  
see the famous New Holland "77"!**

With a New Holland "77" you can bale up to 10 tons of hay an hour. The "77" is rugged, has 20% fewer parts and offers many improvements. Farmers across the country agree there's no finer twine-tie baler!

# Potato Growers Trim Acreage to Fit Demand

**A** YEAR ago potato growers in several areas indicated that they were thoroughly fed up on price supports, especially if they were to be accompanied by strict controls. At that time a number of control-minded Washington bureaucrats went out on a limb and predicted that growers would be sorry; that they would quickly change their minds and be glad to accept the controls after a year's experience in the cold, competitive storms of free enterprise without the protective price umbrella of government price supports.

Well, the time has arrived when it can be definitely said that the prophets of disaster were totally wrong.

We can even admit that the most confirmed opponent of price guarantees never hoped that the disgraceful situation fostered by price supports could be cured in a single year. Yet faced with the cold facts about overproduction in past years, and the total lack of supports for the 1951 potato crop, growers met the situation by curtailing acreage 18%. As a result, the August estimate of 351,186,000 bushels is just about the number of bushels that consumers ate a year ago. There is every indication that potato prices will continue at a fair level, that most of the crop will find its way into consuming channels, and that growers will again strive to meet general competition by putting better potatoes on the market.

The situation is a tribute to the good sense of farmers and a rebuke to all persons who believe that farmers must be guided by "professional planners" controlled by those who think they are all-wise and subsidized by politicians who want their vote.

A review of the desirable results of discontinued price supports on potatoes is worth while:

1. An enormous amount of useless work has been and will be avoided.

Farmers have stopped growing more potatoes than consumers want, with the intention of selling them to the government. Transportation of unwanted potatoes is no longer necessary. Government employees need no longer spend time in checking potatoes and then destroying them and writing checks for farmers.

2. Taxpayers' money has been saved.

The money paid farmers for unwanted potatoes was only part of the cost. Promotion of the program and the administration of it took a sizable chunk.

3. Land has been released to grow crops that are needed.

4. Relations between producers and consumers have been improved.

Housewives never could see the wisdom or justice of dumping potatoes paid for with taxpayers' money. Can you blame them?

5. Potatoes will be grown on the best potato land and by the best growers.

Price supports help to keep the inefficient grower in business. Good potato men with good machinery and know-how do not fear fair competition.

6. Farmers have retained some freedom.

They can grow potatoes where they wish and in what quantities they wish. Extra efforts made by individuals to put better potatoes on the market will be rewarded. Too often, under price supports poor potatoes brought the same price as good ones. In fact, in some cases the livestock got the best

ones and the consumers ate the poorest.

The sooner restrictions on some other farm products are abandoned, the better it will be for everyone.

The case against price supports is overwhelming. In addition to some of the things that have been brought to light by the discontinuing of supports on potatoes, we should remember that "politics" results in higher and higher price supports at a time when they are not needed. It is almost equally certain that taxpayers and politicians would not permit price supports in a time of depression when they might really be of some help. Finally, many a thinking patriotic citizen has stated the belief that we cannot continue indefinitely to arm ourselves, help many nations to arm, and at the same time indulge in and expand socialistic ventures in this country.

— A. A. —

## ROCHESTER GROWERS WIN FAIR AWARDS

**A** MASSIVE, colorful and well arranged display of vegetables won first prize of \$325 in the organization's collection exhibit at the New York State Fair for the Rochester Area Growers' Cooperative, Inc.

The display also won one of the two first prizes of \$200 offered in the Duncan Memorial Award. The other first prize Duncan Award winner was the New York State Cherry Growers Association. Honorable mention for the Duncan Memorial Award was the exhibit of the Western New York Apple Growers Association.

Second prize winner in the organization collections was the Oswego County Vegetable Improvement Association. Third prize went to Onondaga Vegetable Growers Co-op Association, Inc., and fourth to Schenectady Market Growers Co-op Association.

— A. A. —

## GRANGE AND 4-H WINNERS

At the New York State Fair the Grange exhibits brought the following winners: 1st, Busti Grange, Chautauqua County; 2nd, Milton, Ulster County; 3rd, West Groton, Tompkins County; 4th, Lysander Grange, Onondaga County.

The Pomona Booth winners were: Otsego, Cortland and Tioga.

Miss Jean Ortmann of Hurley, Ulster County, was winner of the 4-H Club dress review and will represent New York State at the 4-H Club Congress at Chicago in December. Miss Ann Fisher of Canastota was second.

At the New York State Fair, Bernard Glasner left, and Robert Reisdorf were first and second respectively in FFA Vegetable Crops judging. They are students of vocational agriculture in the Arcade Central School. Along with Gerald Winter of Perry they will represent the State in FFA judging contests at the National Junior Vegetable Growers Association meeting at Columbus.

# Gone to Grass...

**Not** only in the vast ranges of the Great Plains is grass creating new security and wealth. In many old, cropped-out sections a return to grass-and-livestock is restoring "faith and fertility." Areas where once livestock grazed in our great westward migration are carrying livestock again—and with yields in pounds and dollars that sound almost like miracles.

Typical of the new grassland management is the operation centering at Dixon Springs Experiment Station in Southern Illinois. A few years ago this was worn-out, plowed land—practically worthless—raising perhaps 10 bushels of corn to the acre. Today they're getting four to five hundred pounds of livestock gain off those same acres (the record so far is 682 pounds in a season). And they're shooting for a thousand! At current beef, lamb and wool prices, they're netting around \$100 per acre per year—on land where not long ago the animals would literally have starved to death.

How was this miracle achieved? By good farming and ranching practices. By preparing the soil with lime, potash and phosphate. By finding, through hundreds of careful tests, the best combinations of grasses and legumes to give the longest grazing season and grow the most meat. Thus, the land has been made immediately profitable—and still maintained for future use. For under cropping, this land loses a full plow-depth of topsoil in 30 to 40 years; but in *grass*, it will not erode that much in 8,000 years.

Dixon Springs and other experiment stations are pointing the way to a type of farming practice suited to many of the older sections of the United States. Some experienced ranchers of the West and Southwest are extending their stock operations back into Eastern states. In the South, beef cattle are doing well on worn-out cotton land reconverted to grass. This change from crop raising on poor land to livestock production on permanent pasture seems to present a great opportunity to many producers. It could mean the development of great new livestock-producing areas... and more meat for our growing population.

## Quote of the Month

"We need to produce more meat... We can produce more meat in three ways: (1) by increasing livestock in areas where more roughage can be produced and used efficiently; (2) by protecting our livestock from diseases and pests; and (3) by improving breeding, feeding, and management... The production job can be done only on farms and ranches, and by farmers and ranchers."

City Cousin kicked the pig's skin!

T. G. Byerly

## Breeding Limits Beef Cattle Gains in the Feed Lot

T. G. Byerly, Animal Husbandry Division  
U. S. Department of Agriculture

Studies at the U. S. Range Livestock Experiment Station, Miles City, Montana, prove that steers from fast gaining bulls put on weight in the feed lot faster than steers from slow gaining bulls. They also prove that there is no inherent relation between conformation and rate of gain. While small-type steers generally gain slower than large-type, breeders can selectively breed fast gaining small-type cattle as well as fast gaining large-type cattle. Breeding for rapid feed lot gains can be done within type, without hurting type.

Today 35 states are included in this broad cooperative research program with the U.S.D.A. Type, conformation, calf crop, as well as rate of gain are being measured. Bulls are placed on feed at 6-10 months of age under standard conditions. Their rate of gain varies from a pound a day to four pounds a day. *And the steers they sire will vary in the same direction as the sire though usually less widely.*

Breeders in several states are also conducting performance tests by placing bulls at central testing stations for evaluation.

You have to wait until after the calf is weaned to measure his capacity to gain. While the calf is on the cow, her milk supply will affect rate of gain. There just isn't any relation between weight and finish of calves at weaning and their ability to gain in the feed lot.

Through selective breeding we can produce more beef per brood cow and per steer fed, with greater profit.

## Martha Logan's Recipe for HAMBURGER HARVEST CASSEROLE

Yield: 8 to 10 servings

- |                                 |                               |
|---------------------------------|-------------------------------|
| 1 pound hamburger               | 1/3 cup flour                 |
| 1 cup chopped onions            | 2 cups whole kernel corn,     |
| 2 cups cooked tomatoes, drained | drained                       |
| 1 teaspoon curry powder, chili  | 2 cups cooked lima beans,     |
| powder or 1 tablespoon          | drained                       |
| Worcestershire sauce            | 1/2 cup sliced green pepper   |
| 2 tablespoons salt              | 1 1/2 cups shredded cheese or |
| 2 potatoes, sliced thin         | buttered crumbs               |

Combine hamburger, onions, tomatoes, one of the seasonings and salt. Pat into a one-inch layer in a 3-quart casserole. Over this, place the potatoes, flour, then corn, lima beans and green pepper. Top with cheese or crumbs. Bake in a moderate oven (350° F.) 1 hour. Serve hot.

## Soda Bill Sez...

A good head to start with gives a man a good head start in getting ahead.

Good crops make more work—counting the cash.

## How to earn a quarter of a cent

Maybe you read a little while back that in 1950 Swift averaged about 1/4¢ a pound profit on its meat operations. *One quarter of a cent per pound!*

Here's what we do to earn that quarter of a cent per pound of product handled.

First we buy your livestock, then process them and distribute the meat. Every possible by-product is utilized. The income from these non-meat by-products increases the return you get for livestock. It also decreases the cost of meat to consumers.

Next, it's a long way from Broken Bow to Boston. There is an average thousand-mile gap between the places where livestock is produced and the populous cities where meat is eaten. We help bridge that gap for you. We pay transportation costs on our finished products; deliver them to dealers in all parts of the United States. For you producers, this means a broad, nation-wide market instead of a limited local market for your products.

For all these services we earn a net "fee" of 1/4¢ a pound. As you know, that isn't enough to make any important difference either in the amount you receive for livestock you sell; or in the price people pay for meat for their tables.

F.M. Simpson.

Agricultural Research Dept.

*Nutrition is our business—and yours*

## 4-H Livestock Winners at Fair

FRANKLIN County's 4-H members placed first in the County 4-H Dairy Judging Contest at the New York State Fair, followed by other counties in this order: Dutchess, Cayuga, Oneida, Greene, Madison, Monroe, Livingston, Jefferson, Albany, Cortland, Tompkins, Columbia. Broome and Ulster tied for 14th place.

### 4-H Breed Champions

**Jersey:** Grand and Senior Champion—Dorothy Benedict, East Meredith; Reserve Grand, Reserve Senior and Junior Champions—Lillian Melvin, Baldwinsville.

**Ayrshire:** Grand and Senior Champion Silas N. Stimson II, Spencer; Reserve Grand Champion—Abigail A. Stimson,

Spencer; Junior Champion—Donald Cook, Burke.

**Guernsey:** Grand Champion—Nancy Nesbitt, Hobart; Reserve Grand Champion—Delbert Ripley, Cortland.

**Holstein:** Grand and Senior Champion—Jerry Coyne, Avon; Reserve Grand Champion—Sylvia Ann Patchen, Locke; Junior Champion—Charles McEvoy, Preble.

**Brown Swiss:** Grand and Senior Champion—Walter Smith, Watertown; Reserve Grand and Junior Champion—Gerald Thompson, Hunt.

**Market Pig:** Grand Champion—Richard Eliek, Williamson; Reserve Grand Champion—Robert Reid, Caledonia.

**Market Lamb:** Grand Champion and Reserve Grand Champion—M. Samuel Adams, Sodus.

### Showmanship

Garry Nicholls of Nedrow was champion showman in the Ayrshire breed, followed in order by: Silas Stimson II, Spencer; Robert Moran, Avon; LeRoy Weston, Canton; Alan

Brewer, Lockport; Helen Dietz, Ransomville; Beverly Mulvihill, Hyde Park; Richard Cook, Burke; Flora Conklin, Spragueville; Lawrence Nye, Preble.

Champion in Guernsey Showmanship was Mary Kamm of Marietta, followed by: Betsy McVey, Black Creek; Marjorie Huff, Genoa; Nancy Nesbitt, Hobart; Roland Ripley, Cortland; Harold Smith, North Rose; Calvin Smith, Pleasant Valley; William Woityra, Churchville; Lee Hutwelker, Walden; Graydon Stoddard, Rockdale.

In Holstein showmanship top place went to Hilda Sauer of Kyserike, followed by: Sylvia Patchen, Locke; Alfred Cole, Avon; William Behling, Weedsport; Gerald Langdon, Malone; Eleanor Wigsten, Poughkeepsie; Barbara Tucker, Gardiner; Charles Kelley, Camden; Charles McEvoy, Preble; William Rood, Norwood.

## Livestock Champions at N.Y. State Fair

(Continued from Page 6)

ram, Stuart Pease, Mumford. Champion ewe, Dougall Cumming, Russell, Ontario, Canada.

### CHEVIOT

Reserve and Champion ram and Reserve Champion ewe, Four Winds Farm, Glastonbury, Conn. Champion ewe, George Ramsey, Friendship.

### OXFORD

Champion ram, Mrs. Vera Bigelow, Camillus. Champion ewe, Van Fleet Bros., Marcellus. Reserve Champion ram and ewe—Lawrence Davey, Marcellus.

### SOUTHDOWN

Champion ram and Reserve Champion ewe, Mountain Farm, North Hatfield, Mass. Champion ewe, Peter Huntington, Westford. Reserve Champion ram, Edith Smith, Skowhegan, Maine.

### TUNIS

Champion and Reserve Champion ram and Champion ewe, James McGuire, Oakfield. Reserve Champion ewe, Charles Smith, Skowhegan, Maine.

### LEICESTER

All champions won by Dougall Cumming, Russell, Canada.

### RAMBOUILLET

All champions won by Twin Pine Farm, Nichols.

### Lambs

### WETHERS

Champion and Champion Pen of 3, Cornell University. Reserve Champion, Sam Adams, Sodus. Reserve Champion pen of 3, Bellwood Farms, Geneva.

### SHROPSHIRE

Champion ram and ewe and Reserve Champion ewe—Andrew J. Cochrane, Ripley. Reserve Champion ram—Twin Pine Farms, Nichols.

### DORSET

Champion ram and ewe and Reserve Champion ewe, Howard J. Hill, Albion. Reserve champion ram, Cornell University.

### Swine

**DUROCS:** Grand, Junior and Senior Champion and Grand and Senior Champion sow—Allen H. Post, Auburn; Jr. Champion sow, Edgar C. Angle, Afton.

**SPOTTED POLAND CHINA:** Senior and Grand Champion boar and Senior and Grand Champion sow, Fan Ling Farm, Hamilton; Junior Champion boar and sow, Marion B. Tyler, South Byron.

**BERKSHIRE:** Senior and Grand Champion boar and Senior, Junior and Grand Champion sow, Kenneth L. Wiley, Penfield; Junior Champion boar, Sunny Bank Farm, Jordan.

**CHESTER WHITE:** Grand and Junior Champion boar, M. B. Tyler, South Byron; Grand and Junior Champion sow, Frank Hollier and Sons, Jordan.

**POLAND CHINA:** All champions: E. S. Cable and Son, Canton, Ohio.

**YORKSHIRE:** Grand and Senior Champion boar, Whitewood Farm, Wolcott; Junior Champion boar, Airy Knoll Farm, Woodstown, N. J.; Grand, Senior and Junior Champion sows, Giera Bros., West Springfield, Mass.

**HAMPSHIRE:** Grand and Senior Champion boar, Duane Ford, Elba; Junior Champion boar, T. Maurice Fagan, Livonia; Grand and Senior Champion sow, Donald Culver, Aurora; Junior Champion sow, Duane Ford, Elba.

**BARROW SHOW:** Champion barrow (Berkshire), John Blick and Sons, Williamson; Reserve Champion (Berkshire), David Wilbur, Avon. Pen of three (Berkshire), W. B. Stewart and Son, Piffard.

# WHEN A MAN MAKES HIS LIVING MILKING COWS, THE RIGHT MACHINE CAN SPELL THE DIFFERENCE BETWEEN PROFIT AND LOSS

## THAT'S WHY SO MANY THOUSANDS OF FARMERS INSIST ON GENUINE SURGE TUG & PULL

Neighbors tell neighbors, "It will pay you well to switch to SURGE" ... so ... in 1951 Surge Service Dealers are out fighting the roads to get a new SURGE milker to a man who wants one right now!

If you milk cows for a living, ask your Surge Service Dealer to come out and show you how SURGE can make yours a better living.

## BABSON BROS. CO. of N.Y.

842 WEST BELDEN AVENUE • SYRACUSE 1, N. Y.

### WHAT CAN YOU DO?

EVERY day someone uses vigorous language in articles or speeches to tell of the dangers of continued non-defense deficit spending by government. Meanwhile deficits grow while politicians continue to propose new socialistic ventures.

Is there a remedy? What can you and I do, individually or collectively to stem the tide?

For the best 500 word letter answering these questions, we will pay \$20; for the second best, \$15, and for the third best, \$10.

Send letter to American Agriculturist, Box C, Ithaca, N. Y., before October 20. Winning letters will appear in the December 1 issue.

*Around the*  
**PURINA**  
*FARM with*  
**ELMER POWELL**  
DIRECTOR RESEARCH DEPT

Yorkshire brood sow (No. 10) is now in the spotlight at the Farm. Last April she farrowed 17 live pigs. On June 20, she weaned all 17. These pigs were nursed all the way by No. 10. But since there were only 12 plates at the dinner table for these youngsters we had to divide the litter in two groups and nurse them in shifts. Evidently Madame Brood Sow never knew the difference, for at weaning time she was still in fine body condition. The pigs were creep-fed Pig Martena, too.

\* \* \*

But look at this! Weaning these 17 pigs brought No. 10's total to 118. Pigs weaned in 10 litters. That's a new record for our Farm. Just look at the average—nearly 12 pigs weaned per litter for a total of 10 litters.

\* \* \*

I'm pretty enthusiastic about No. 10, but I shouldn't slight a little lady who made quite a showing of her own at the Calf Barn. Did I say "Little" lady? Well, Guernsey heifer No. G-134 actually weighed 308 lbs. when she was 4 months old. You know the average for the breed at 4 months is 177 lbs. At the Farm in 1950 our average was 23 lbs. So you can see this heifer has the makings of a great milker. She keeps on like she's started.

\* \* \*

Many problems arise in caring for our pheasants as, unlike turkeys, pheasants still retain their wild instincts. Being wild, they are very nervous in confinement and use up a lot of energy pacing along the fences. However, we are having success in getting pheasant hens to lay in nest boxes. This management feature saves a lot of eggs from being broken.

\* \* \*

Time and again we've found that early growth is the cheapest growth. Cecil Hite, who is head of our record department at the Farm, explains it this way: "In 7 weeks 49 days we grow a 2 lb. or better broiler on 4½ lbs. of feed. In three weeks more we can add another pound and a quarter, BUT it may take 5 lb. or more of feed to add this extra weight. It just takes more feed for heat and energy as birds get older, so we recommend feeding for fast growth."

## Young Dairyman Shows How to Set the Pace

by Bruce K. Symonds

DICK HAXSTUN of Ford Edward, N. Y., is a self-made young dairyman. Everything he has, he's had to earn the hard way. That's why, when you walk into the barn and see his string of 15 registered Guernsey milkers, it gives you the feeling that there's still plenty of opportunity for the young farmers coming along to make good.

Dick started out with his Dad, keeping purebred stock nine years ago but had to leave them in his Dad's care during the war years.

His plan has been to develop slowly, buy some foundation cows, raise heifers from them. Now he's gradually built the herd up to 34 in all. One of these, Eycone of Hickory Hollow, as an 11-year-old made 17,659 lbs. of milk, 931 lbs. of fat. This made her the No. 4 mature Guernsey cow in the country.

Dick hasn't spent all his time with bloodlines and breeding, however. On his 80 acres of tillage, Dick grows both corn and grass silage. He says he especially likes to put the first crop into a silo because he can save the quality of a crop that might be lost in bad weather.

With his fields, Dick follows a regular rotation plan. By top dressing and fertilizing he keeps

the land in high gear production all the time, a big factor in earning fatter milk checks.

In addition to hay land, Dick has 14 acres in permanent pasture, seeded to ladino, orchard grass, bird's-foot trefoil, and alfalfa. He has found this pasture a big help in maintaining high production economically.

"Heavy milkers can't get along on just roughage alone," Dick pointed out. "When they're giving 70-75 lbs. of milk a day, they've got to have a grain ra-

tion that will help them keep their flesh as well as make milk. That's why I insist on conditioning all my cows on Purina D & F and then shifting them over to B & M Cow Chow when they go into the milking herd."

Always keen to adapt better dairying methods, Dick recently built an 8-ton storage bin directly above the stable so he can use gravity fed chutes and save all the work of handling bags every time he feeds. His Cow Chow is delivered directly from the Glen Falls Chek-R-Board Store siding. Not only does this method save labor and bags but also eliminates the rat problem.

For those who continually cry that the present offers nothing for the younger generation of farmers, let me suggest that they call on Dick Haxstun to see for themselves that where there's a will, there's still a way.

### Fat averages show the kind of job Dick is doing.

Year	Cows on Test	Fat
1946	7	503 lbs.
1947	13	486 lbs.
1948	13	524 lbs.
1949	12	495 lbs.
1950	14	571 lbs.

Moreau Farms Sunshine made 16,316 lbs. of milk, 701 lbs. of fat as Senior 4-year-old. Established herself as No. 10 cow in her class for the breed. As a 7-year-old, she gave 19,208 lbs. of milk and 841 lbs. of fat.

## Trip through an EGG FACTORY...

**Purina Research photos show how an egg is made**

**O**F INTEREST to every poultry keeper is the process by which an egg is made. For the success of this wonderful 24-hour job determines the number of eggs you'll get. Purina scientists have studied this "trip through an egg factory" in their constant efforts to make better and better Chows for your hens. For these pictures they killed and cut open many hens. Thus they were able to catch an egg in each step of its trip.

The picture at right shows the egg-assembly line. Scientists call it the ovary and oviduct. These have been cut away from the rest of the hen's inside so you can see them clearly. The tube itself has been cut open and the parts labeled.

In this short tube, measuring less than two feet, an egg can be assembled every 24 hours. It's one of the most amazing and exacting jobs in all of nature's wonderful processes.

**1. REPRODUCTIVE SYSTEM** is shown here in its natural shape and position. The cluster of several thousand yellow yolks is contained in the ovary. Under the influence of good feed and good body condition, the yolks develop in size. When a hen is laying heavily, one of the largest yolks breaks away approximately every 24 or 25 hours.

**2. YOLK BREAKS THROUGH SACK.** First a small bubble appears on the sack or protective covering. Slowly the yolk breaks through. At this point it is nearly full size, having been fed in the ovary. When a chick is hatched, it has more potential yolks than it will ever use. Breeding and feeding influence the number which will develop to full size.

**3. YOLK DROPS INTO FUNNEL** at the end of the egg-manufacturing tube. Scientists have named it the infundibulum. How the funnel knows which yolk will break through, and why it is there to catch the yolk when it falls, are unsolved mysteries of nature. The egg-making tube has been straightened out to show its full length.

**4. YOLK GOES THROUGH THE MAGNUM,** where most of the white is deposited around the yolk. This takes about two hours. The materials for the white — in fact for everything added to the yolk — are carried from the stomach and intestines by the blood. The nutrients are filtered through the walls of the egg tube and deposited on the forming egg.

**5. EGG ENTERS THE ISTHMUS,** where it spends about two hours. More white is added, but the big job is addition of two shell membranes. In this picture, the egg tube is not cut open. You can see the bulge where the egg is located. In the preceding picture, the wall of the egg tube was cut open revealing the yolk surrounded by white.

**6. SHELL IS PUT ON IN THE UTERUS.** The egg remains here for 19 to 21 hours. If a hen's ration is short in necessary vitamins, minerals, or amino acids, she will supply them from her own body tissues for a while. Soon she becomes run down. Then she stops laying. It is the job of feed to supply materials needed for a whole egg every day.

# PURINA CHECKERBOARD NEWS

## Purina Announces the First **BODY AND EGG PLAN** Built for Today's High-Producing Hens

Ancient jungle fowl —  
Bred to lay 15 eggs

1800 — Bred to lay  
60 eggs

1925 — Bred to lay  
150 eggs

1951 — Bred to lay  
200 or more eggs

Good poultry breeders and hatcheries have made great strides in improving the modern hen. It took centuries to breed hens that would lay 50 to 60 eggs yearly. As late as 1925 few hens were bred to lay more than 150 eggs a year. In those days the demands upon the body were not very great. Neither were the demands on feed. The hen had time to store up nutrients needed to lay her eggs and keep up her body, too.

Today, good birds have the bred-in ability to lay 200 to 300 eggs a year—sometimes even more. The tear-down on the body is terrific—*unless feed is balanced to supply every need.* Purina Farm and Laboratory workers of late have been spending much of their time studying the problem of BODY as well as EGGS.

Through our study of body needs we have found that several vita-

mins often can be used in larger amounts than formerly thought necessary. We have added these to the Purina Laying Chows.

Then we have added a revolutionary new feed—PURINA BOOSTER CHECKERS. These are extra high in proteins, minerals and vitamins. They may be top-fed on regular Laying Chows during times of greatest nutritional stress. These times include:

1. Pullets during the first 4 to 5 months of laying.
2. Birds out of condition.
3. Unsatisfactory production.

**HOW TO FEED**—Feed Purina Layena, or Lay Chow and grain. If you feed a mash, top-feed Purina Layena Checkers. If you are feeding Checker-Etts, Layena Checkers are not necessary.

During times of nutritional stress, you may eliminate Layena Checkers and top-feed new Purina Booster Checkers instead. Allow 3 lbs. a day until pullets are in 50% production—6 lbs. if higher.

### RESULTS TO EXPECT

1. *Pullets during first 4 to 5 months of laying.* Aids body condition and growth. Helps maintain heavy production.
2. *Birds out of condition.* Put them immediately on Booster Checkers. Helps bring them back into condition and production.
3. *Unsatisfactory Production.* When a flock just seems to be stymied at an unsatisfactory level, the Body and Egg Plan often starts them up.

### See the New Body and Egg Film

Sometime within the next few weeks your own local Purina Dealer will show the new Purina Research film "A Trip Through an Egg Factory." It shows the full egg-making process far more in detail than the pictures on the opposite page. It literally tells you how a hen makes an egg.

This same meeting also tells you about the great new Purina Body and Egg plan and how you can use it in your own flock.

Be sure to see this FREE educational film. Ask your Purina Dealer when it's coming. If you prefer, just mail a card to Checkerboard News, Ralston Purina Co., St. Louis 2, Mo. Tell us you want to see the film and we'll notify your dealer so he can give you his showing date.

### The Pullet Is Under Greatest Nutritional Strain

She has to finish her growth—adding 1 to 2 pounds to her body by maturity at 10 months. She also is laying her heaviest—80 to 100 eggs in the 4½ to 5 months before

she completely matures. This puts a double strain on her body. The new Body and Egg Plan aids condition during this time . . . helps guard against egg slumps later on.

## FIND YOUR PURINA DEALER LISTED HERE

Purina Research has done it again! For the first time, Purina has photographed in color the development of calf embryos. Photos show development from one month to just before calving. Your Purina Dealer will show this film soon. Ask him when you can see it. Don't miss this interesting story of calf growth!

## FARM HANDIES

### Feed Chutes to Each Pen

Glen Shelhamer, Fairport, N. Y., has constructed feed chutes to carry the Breeder Checkers into each pen in his 25 x 100 ft. breeder house. Then all he has to do is to pull a slide near the outlet of each chute and fill his feed bucket. This saves building a carrier or bringing in the feed by hand.

## CALAMITY CAL...

by ed smyth & bill sims...

## CLAMBAKE Jonesville Style

(Continued from Page 1)

sold. Each ticket is numbered, and a like number is placed on a plate at the table, so one only needs to look at his ticket and then find that same number on a table. Consequently, there is no crowding or confusion.

At the end of each long table is a serving table which becomes a business center for that table. Each table also has an operating committee to take care of the needs of the guests at that table.

At exactly five minutes to two, the chairman gives the "GO AHEAD!" signal, and helpers begin to open the bake. By two o'clock those waiting at the tables are being served clams, chicken, sausage, potatoes, and sweet corn, accompanied by foods already on the tables—sliced tomatoes, cabbage salad, cucumbers, butter, pickles, rolls, and steamed brown bread. Coffee is served by the waiting committees.

"All you can eat!" seems to be the slogan for this meal. Clams disappear like magic. Even the shells do not remain as evidence. What to do with the empty shells troubled one woman as she removed a delicious morsel of clam and looked for a place to discard the shell.

"I guess this is your first clambake," came from the stranger sitting next to her. "Just chuck 'em under the table."

Everyone at the bake eats as much of everything within reach as he can, and then sits a little straighter and takes in a few more clams. No one seems the least embarrassed at the number of shells under the table at his feet. One man admitted he consumed 80 clams. At that rate he ate a good share of the Church's profit on his \$3.75 ticket!

When all the guests have reached their extended capacity and retired from the tables to visit with friends, the Clean-up Committee takes over, and in quick time the tables are cleared, dishes washed on the serving tables, whisked to the church kitchens and stored in their regular cupboards. The clean-up committee is not hungry, nor waiting to feed on left-overs. They have already eaten their own individual lunches, brought from home. All the bakes are planned to bring in as much income as possible for the Church, so all helpers cheerfully bring and eat their own lunches.

As soon as the tables are cleared, men with trucks, hammers, and break-up equipment back up to the lawn, and as quick almost as one can tell it, the tables disappear as boards to be taken away by the purchasers of this new lumber which has been used only a few hours as tables. In a few minutes even the clam shells have been swept into bushel baskets and carted away.

No circus crew, getting a circus on wheels ready to move, operates more quickly and more efficiently than this crew of friends and neighbors working together for a community church. By 4 o'clock, just exactly two hours after the first basket of clams was taken out of the bake, the grounds are clear of all evidences of the annual event, except the sand and rocks where the bake was cooked and a few people still lingering in the warm late-summer sunshine. All bills have been paid and the cash profits counted. However, values resulting from people working together for a cause cannot be counted. They can only be appreciated and measured by happy results.

Those who attend these clambakes, and who understand their goal and the teamwork needed to achieve that goal, go away feeling that Jonesville, New York, with its Annual Labor Day Clambake has become a proving ground for the democratic way of life as this particular group of citizens see it.

# Co-op Tax Plan Eased

Worst Features Dropped as Storm of Letters and  
Telegrams from Dairymen's League Members  
Engulfs Senate Finance Committee

**M**ODIFICATIONS in the Senate Finance Committee's punitive proposals for taxing co-operatives have been made largely as the result of a vigorous protest from farmers all across the nation. As soon as the Senate Tax Committee's proposal was announced, Dairymen's League President Leon A. Chapin led off the protest with a newspaper statement branding the proposals as discriminatory and designed to limit the size of farmers' co-operatives.

The statement was immediately enlarged upon in the Dairymen's League News and in an urgent letter to Directors and County Presidents. League members responded with a storm of letters and telegrams to Senators. At the same time, President Chapin and other League officials assisted the National Council of Farmer Co-operatives and the National Milk Producers Federation in impressing Senators with the grave injustice of the tax plan.

### Fear More Attacks

Secretary of Agriculture Brannan pointed out from Washington that the plan to tax co-operatives is the strongest attack on agricultural programs that has been made for some time. If it succeeds, others will follow, he warned.

The farm population is dwindling steadily. Farmers are not as strong numerically as they were when much of the agricultural program was adopted. That means farmers can no longer depend upon government to protect their rights and interests. Only strong, aggressive co-operative organizations can shield them from punitive or discriminatory laws. Organizations such as the Dairymen's League which many times during every year renders similar service in the interests of its own membership and of all milk producers in the milkshed.

## Neighbors' Day at Gannett Farms

By L. B. SKEFFINGTON

THE ADVANTAGES of a Green Acres program were apparent when some 1,300 persons turned out for the annual Neighbors' Day at Gannett Farms. During the 30 days preceding the event, there had been exactly six-tenths of an inch of rain. In spite of this, pastures were green and growing, although day by day the rate of growth was slowing down.

Bill Garman, Cornell agronomist, who led the field tour, pointed to a field on which cows were grazing and which had been clipped three weeks previously. "The fact that there is any grass at all speaks well for managed pastures," he said. "In this case the ladino clover and brome grass are coming very slowly, but the alfalfa in the mixture is making comparatively good growth because it is well established and has long roots."

He noted that it was the fifth round of grazing for the year on the pastures. After each round the lots were clipped and given a chance to make a comeback. After the first grazing of the season, or the first cutting for grass silage, the lots were given a top-dressing of 400 pounds of 0-20-20. It was explained that on this farm we had tried various amounts of fertilizer and had concluded that we did not benefit as much with less than 400 pounds. We have not been quite sure whether or not the alfalfa needs boron, so in alternate years 0-19-19 with boron has been used.

We had plenty of rain up to mid-July and pastures were lush until about August 1. Then in a drought that continued for 40 days, growth lessened.

### Silage a Lifesaver

In spite of the drought, we did not feed a forkful of silage until the last day in August. Then we opened a silo and began feeding a moderate forkful of grass morning and night. At the same time the cows were given all the dry hay they would eat. Gradually we began feeding a little more grass and the cows showed less interest in the dry hay. As a result, milk production stayed right up where it had been on good grass pasture.

One observation we made about feeding grass-silage was that we feel cows always should have access to a little dry hay. We never have had a symptom of bloat even on our lush pastures and we attribute our good luck to clipping enough of the lots so that the cows always can find dried clippings. We think that there is little danger of cows getting too much grass silage if they are eased into it and if they get a chance to nibble at dry hay when they want it.

Garman brought out another point at the field day—that we had no feeding problem because we had filled two silos with June surplus from the pastures.

### Short-Rotation Problems

On some of our contours we have been attempting to improve the soil in a short rotation of corn, oats and wheat. Our normal practice is to sow ryegrass on the last cultivation of corn and plow it under the next spring to be followed by oats. Wheat is planted after oats and seeded to mammoth red clover, plowed under the following spring and followed by corn. We had one lot where corn followed corn and another where clover was left out of the rotation. Both of them showed moderate nitrogen deficiencies, and the corn-after-corn showed a puny stand in comparison to nearby lots.

Dr. C. E. F. Guterman, research director at the State College of Agriculture, said he liked to think of the farm as the "Gannett-Skeffington Experiment Station." He said there were

at least three steps to carrying out a good research program. "First," he said, a problem is recognized, perhaps by farmers bringing it to the college. Second, the scientists go to work and attempt to find out what should be done to correct it. Third, the corrections are applied in farm demonstrations under practical conditions. The cooperation of a place like this frequently is valuable in showing practical results."

Mr. and Mrs. Frank Gannett welcomed the crowd. The former said, "Nothing has given me as much pleasure as to be able to help just a little bit in meeting some of the challenges that face farmers." Mrs. Gannett told of her work as a member of the Board of Regents and its great interest in a wide variety of matters that affect the business and home life of every rural family.

In the field trips, a center of attraction was Wesley Moffet's "Barnyard Bazooka," designed to hurl baled hay and straw into the mow. Some Ford and Dearborn equipment was demonstrated and the crowd followed the "rotovator" as it pulverized stubble and soil. A new quonset hut with a smooth concrete floor was put to use after dark when a hill-billy band whooped it up for old-fashioned square dancing.

"Neighbors' Day" at Gannett Farms is an annual event sponsored in cooperation with the Monroe County Farm Bureau. Fred H. Snyder, association president, presided and program planning was handled by Herb Johnson, County agent, and Paul Turner, farm engineer.

### CHOCOLATE CAKE CONTEST WINNERS

FOURTEEN more Grange sisters and one Grange brother are on their way to the finals in the big state-wide Chocolate Cake Contest which AMERICAN AGRICULTURIST and the New York State Grange are sponsoring jointly. Hundreds of dollars in cash, groceries, and household equipment will go to State winners this fall. Here are recent county winners:

#### POMONA WINNERS

COUNTY	GRANGE	WINNER
Allegany	Belfast	Mrs. Mae Benjamin
Chenango	Otselic Valley	Mrs. Barbara Stiles
Erie	Springville	Mrs. Clare Lindsley
Fulton	Crum Creek	Floyd Groll
Herkimer	Cathactackne	Mrs. Helen Yonker
Lewis	Beaver Falls	Mrs. Alfred Marolf
Onondaga	Tully Valley	Mrs. Betty King
Orleans	Waterport	Mrs. Dorothy Plummer
Rensselaer	Hoosick	Mrs. Mary Rudd
Schuyler	Townsend	Mrs. Doris Berry
St. Lawrence	Heuvelton	Mrs. Jay Dodds
Steuben	Woodhull	Mrs. Vera Friends
Tompkins	East Lansing	Mrs. Russell Luce
Wayne	Williamson	Mrs. Roger Fisher
Wyoming	Bliss	Mrs. Anna Walton
Yates	Rushville	Mrs. Howard Gorton

Wayne County's chocolate cake champion, Mrs. Roger Fisher of Williamson, N. Y., member of Williamson Grange. The recipe from which she made her prize winning cake was handed down to her from her grandmother.

Rudy Bartman, Penstix-SM booster on his Nebraska dairy farm.

## MASTITIS NO LONGER PROBLEM SINCE USING WYETH'S PENSTIX®-SM

SOUTH OMAHA, NEB.—Father and son, Pete and Rudy Bartman, operate a prosperous 143-acre dairy ranch here, regularly milking about 36 cows, mostly Holsteins.

Asked about troubles with mastitis, Rudy said, "This year was one of the worst we've been through as far as mastitis is concerned. We had a lot more rain than usual and plenty of mud...made cleaning up pretty tough.

"When we spotted mastitis we gave it fast treatment with Penstix-SM...and usually our worst cases were cleared up in under four days. Often two sticks did the job. We prefer Penstix-SM bougies because they're so easy to insert and they don't discolor the milk.

"We've never had to sell a cow as a result of mastitis since using Penstix-SM," Mr. Bartman stated. "You can certainly put us down as satisfied users."

CONSULT YOUR VETERINARIAN AS YOU WOULD YOUR PHYSICIAN

### WYETH'S PROVEN PRODUCTS FOR MASTITIS CONTROL

• PENSTIX penicillin bougies or PENSTIX-SM, penicillin-streptomycin bougies (the combined antibiotic treatment for more severe infections) are available at your drug, feed or Animal Health Products store.

• For cows with dry quarters, or with more deep seated infections, many dairymen prefer WYETH PENICILLIN OINTMENT or PENICILLIN-DIHYDRO-STREPTOMYCIN OINTMENT, in handy easy-to-insert tubes.

WYETH  
Incorporated,  
Philadelphia 2, Pa.

## Letters to the Editor

### STUCK HIS NECK OUT

MANY of us farmers are pleased and in accord with your editorial about the USDA meetings which appeared in the September 15 issue. I attended our local meeting to see what was going on. Outside of the heads of the several agencies present, there were less than 1 per cent of the farmers in the county at the meeting.

At the meeting a representative of each of the agencies—Soil Conservation, FHA, the Federal Land Bank, the Farm Bureau, and two or three others—gave a sort of a sales talk, after which there was to be an open discussion. I stuck my neck out and told them that before I came I thought it was a packed meeting, and after listening I was sure I was right. Personally I doubt that any of the representatives of the USDA programs were sold on the procedure, but I felt that they had to go along.

If there was a difference of opinion on a question, a vote by those present was taken. The Farm Bureau, Extension Service, Soil Conservation, the Federal Land Bank, and Production Credit were the most popular and satisfactory. The thoughts on crop insurance, price controls, subsidized superphosphate and lime were entirely negative. The idea of price supports was disapproved except that they might be kept low enough so they would not stimulate overproduction.

—H. F., New York

—A.A.—

### A GREAT FARM

ONE OF the farms with which I have been familiar for many years—in fact, ever since I was a county agent in Delaware County—is the MacDonald Farm at Delhi, New York, operated for many years by Miss Elizabeth MacDonald, a former president of the New York State Home Bureau Federation, and her sister Isabelle.

This farm has been in the MacDonald family for over a hundred years, and each generation has left it better than they found it. There are over 250 acres, with a beautiful, completely modernized home. There are 2 five-room modernized tenant houses, and the farm buildings are all in good condition.

The farm carries over 70 head of cows, and what is more important, it produces enough hay and grass even in dry years to feed them.

Unfortunately, the time has now come when the farm must be sold, and Miss MacDonald tells me that she and her sister want to sell it to young farmers of ability and aptitude who will operate this farm as it has been operated for the past hundred years.

Here is an opportunity for a father and son, or for a two-brothers operation. There are no agents or commission involved. If interested, write to Miss Elizabeth MacDonald, Delhi, Delaware County, New York.—E.R.E.

—A.A.—

### POINT OF VIEW?

In the AMERICAN AGRICULTURIST of June 2, 1951, under "Chaff", you ask when a calf becomes a heifer. This question is frequently raised and I have the answer:

If one has an animal 2 months or more old, and wishes to sell, he calls it a heifer. But if he is buying an animal under 1 year of age, he calls it a calf. It is all in the point of view.

—Lynn M. Follett, Hubbardsville, N. Y.

EDITOR'S NOTE: Heads I win; tails you lose.

## Supply is Going Fast!

## Why Ventilate your Dairy Stable?

**B**ECAUSE a well-designed electric ventilating system helps prevent rotting timbers in the barn structure. It also helps keep stable air fresh and dry, eliminates drafts, and improves the health of the livestock.

*You pay for a ventilating system whether you have it or not. Without ventilation you pay in repair bills, veterinary bills, in decreased milk production.*

The Fairbanks-Goodman electric ventilating system, developed at Cornell University, is used successfully by thousands of farmers. Why not install it now, before winter sets in? Our Farm Service Representative or your County Agricultural Agent will be glad to help you with plans and suggestions.

**Lighter...  
Faster... Tougher**

**27 lbs., ... 4 H.P.  
More power per lb.  
than any other saw**

It's the newest and the best ... lighter and easier to handle. Yes and faster, *much faster*. Cuts an 18 inch tree in 16 seconds. Cuts trees 48 inches or more in diameter. It's a one-man saw that really does the work of other two-man saws. And whether you're felling, bucking, undercutting or notching, this new Homelite Saw will give you greater output because of its easier handling, less fatigue on the operator and greater productive power. Built and backed by Homelite, manufacturers of more than 300,000 gasoline-engine-driven units. This new, rugged, lightweight saw is the one saw that will give you more cutting with less maintenance than any other saw. We can prove it. Ask for a Free on-the-Job Demonstration.

## Question Box

**Under modern management and fertilization, how much hay can be grown per acre?**

On a dry basis, it is figured that you can grow three tons of hay per acre per year. However, it takes pretty good land, well fertilized, to do it. For example, one recommendation on legumes is 200 lbs. of 0-15-30, either in the fall or spring, and another application of the same amount in mid-summer. On grasses, one recommendation is 600 lbs. of 10-10-10 per acre per year, either in the fall or spring.

**What is a good standard for the amount of hot water needed per day for 30 cows?**

It is a good idea to figure on 60 gals. of hot water per milking, which allows plenty for rinsing equipment, washing udders, dipping teat cups, and washing hands and utensils after milking.

**As long as apples will hang on the tree, do they ripen more rapidly there or after they have been picked?**

Unless the apples can be moved into a cold storage immediately, they will ripen faster after picking than while hanging on the tree.

**How can hoof rot in cows be prevented and treated?**

A common preventative measure is to put a shallow box containing 4 to 5 inches of hydrated lime in the doorway where the cows must step into it.

Cows that limp should have a prompt cleaning of the foot followed by soaking in disinfectant and bandaging to keep clean.

**How long does it take to grow evergreens to Christmas tree size? What are the fastest growing varieties?**

Five years is about the shortest time in which you can expect to grow 6-foot evergreens. Red and Scotch pine are fast growing.

**When should strawberries be mulched, and how deep?**

Wait until the ground is frozen, say in late November. Use two or three inches of mulching material. Straw is good, but watch to see that it is clean. Straw from grassy grain fields can start your strawberry patch toward being a meadow! Sawdust is being used to a considerable extent, but don't use too much.

**Is it advisable to put lime on the surface and plow it under?**

This is one of the best ways of adding half of the lime. The rest can be harrowed into the land after it is plowed. Lime spread on the surface works down into the soil slowly. However, on permanent pastures that cannot be plowed, spreading on the surface is the only available method.

**Are figures available to show how much crop yields are increased by plowing on the contour?**

Some experiments over a 5-year period indicated that sweet corn produced 15% more and potatoes 19% more on contour than when rows went up and down a slope.

**What causes alfalfa to run out?**

There are several possible causes, including diseases, insects, unadapted varieties, poorly drained soils, late mowing or grazing, and too little fertilizer.

**How can boron deficiency be detected in apple orchards?**

It first shows at the tips of growing shoots. Leaves become narrow, smooth-

American Agriculturist, October 6, 1951

edged, stiff, leathery to the touch, and the main veins seem large for the leaves. Later the leaves bunch together to form a rosette at the tip of the shoot.

**Does management help to control crab grass in lawns?**

Mowing at 1½", or higher, controls crab grass better than closer cutting.

**What is the best poison to use for killing Japanese beetles?**

When Japanese beetles are eating foliage, use DDT. Two lbs. of 50% wettable DDT powder in 100 gals. of water is the formula. This is at the rate of 1½ level tablespoons to a gallon.

Dusting with 5% DDT can be done, but may require weekly dustings.

— A.A. —

*It's Handy*

## DON'T RUIN GOOD BELTS

When putting on a wide belt, don't use the method shown in Fig. 1. That sketch shows how wide belts are commonly run onto a moving pulley, the lower pulley being the standing pulley and the upper pulley the running pulley. The method is wrong because the belt is too far over to the left on the lower pulley and is in such a position that the left-hand edge of the belt may be stretched seriously before the belt will pass completely onto the upper pulley. This may not LOOK like much of a stretch, but when it is considered that the upper pulley is round and that the actual stretch is equal to 3.14 inch-

FIG. 1

FIG. 2

es for every inch of radial difference, you will begin to realize how important it is to put a wide belt on properly. The wider the belt, the more serious this matter can be.

Fig. 2 shows the correct way in which to put on a wide belt. By holding and guiding the belt so that it will run onto both pulleys simultaneously, there will be no uneven stretch.

## UNUSED PAINT

One of the best ways of preserving paint for future use is to put the cover on tight and store the can upside down. — Dr. A. N. Drury, 63 Loring Road, Winthrop 52, Mass.

## LOCKED STARTER

I have a large truck on which I had a heavy load. I locked the starter. There was no help around. I jacked up one hind wheel; put it into high and turned the wheel back. It broke the starter loose. Be sure to keep the key turned off.

— H. Burk, R.D. 6, Box 82, Schenectady, New York.

# BABCOCK'S HEALTHY CHICKS

MAKE GREAT LAYERS

At the 1950 Storr's Conn. Egg Laying Test, our White Leghorns won first all breeds, with 3399 eggs and 4124.5 points. For the fourth time we won the high leghorn pen at the Georgia Test. Other 1950 records were good but not outstanding. In every test entered our Leghorns placed fifth or better. We still hold the all-time World's record for all breeds, all tests won in 1944-45.

WE HATCH THE YEAR ROUND  
White Leghorns, Red-Rock Cross, Rhode Island Reds and Barred Rocks. We own two hatcheries with 600,000 egg capacity, three poultry farms and 15,000 breeders. We carry on a complete pedigree-progeny testing program.

# DISINFECTANTS IN THE POULTRY HOUSE

SAVE time and money. Pour disinfectants down the drain rather than use them on dirty surfaces. The job is simpler and easier that way, and it saves a lot of time. Of course, disinfectants don't do any good down the drain, but neither do they on dirt.

I'm not saying that disinfectants don't have any value or that they should not be used. I am saying that if these compounds are not used with reasonable care, they might as well be forgotten.

There is no best way to clean. Either hot or cold lye solutions are very helpful in loosening dirt and cleaning surfaces. High pressure steam is excellent for this work but often not available. A vacuum cleaner removes dust very

Bruce Keeney and Kenneth Wing of the Letchworth Central School at Castile, N. Y., took first place in FFA poultry judging contests at the recent State Fair. As individuals, Kenneth was first and Bruce fourth. Second place went to the Cattaraugus County team and third to Allegany.

well but is not very practical for use in large buildings. Water sprays are very useful and work best at high pressure. Thorough cleaning requires a lot of work, regardless of cleaning methods used. Any method is satisfactory if it produces thorough cleaning. Actually most disease-producing bacteria and viruses die rather quickly on well cleaned surfaces. That is why the use of plenty of elbow grease in cleaning a place is of first importance. The application of a disinfectant is practically useless following improper cleaning.

After cleaning and spraying an approved disinfectant on all surfaces, it is advisable to leave the place empty for four to six weeks. Time works for you to finish any part of the job you might have missed.

How long will disease producing bacteria and viruses live in an empty building? The answer depends on which of the disease organisms is involved. Even with this information there is no good answer to the question. On clean dry surfaces most bacteria and viruses die in several days or less. If they are protected as in deep wet cracks or dead birds and in litter, they may live for years.

If you attempt to eradicate a disease from your farm, depopulate completely and clean and disinfect thoroughly. To do less is usually a waste of time and money.—G. H. Snoeyenbos, Department of Veterinary Science, Mass. State College.

If you wish to keep your light and heat, you must also keep your sun. If you wish to keep your perfume, you must keep your flowers. If you wish to keep your forests, you must keep your trees, and if you wish to keep your rights and liberties in education, you must also keep your God. That is the American heritage.—Reverend Monsignor Fulton J. Sheen, National Director, Society for the Propagation of the Faith

# SAVE as you GO

You can actually save costly repairs and save the life of your tractor, truck and car with Sinclair Gasoline. Here's how —

A secret ingredient, RD-119, now in all Sinclair Gasolines, forms a protective film inside your gas tank and fuel system . . .

Thus, when used regularly, powerful Sinclair Gasoline stops rust and corrosion, saves you repairs . . . saves you plenty as you GO!

RD-119, Sinclair's secret rust inhibitor, stops the rust and corrosion that normally form from moisture condensation in fuel systems. When used regularly, Sinclair Gasolines help prevent hard starting, stalling, sputtering . . . and save you costly repairs to gas tank, fuel line, fuel pump, and carburetor. So — Save as you GO with Sinclair Gasoline. Use it regularly. No extra cost!

By J. F. "Doc" ROBERTS

**L**IVESTOCK and meat are again on the front pages of our newspapers. This time it seems to be a deliberate move by the "controllers" to create an emergency.

Things were working out fairly normally after Congress threw out the worst features of the present control law, even over the protests of those who were losing some of their power to control us. Soon after this, another group in Washington raised all packing house employees' pay 9 per cent. Then hides broke in price to more than 6 and 7 cents a pound below ceilings; fats took a similar break, and calf skins even more.

When the O.P.S. set up meat and livestock ceiling prices and regulations, they took great pains to tell the public how fair, equitable, and right these prices were. If they were right then, they cannot be right now; yet O.P.S. still refuses to make any adjustments, or are so tied up with bureaucracy that they cannot. The supposition in the industry is that they do not want to clear it up, but are deliberately delaying it so as to upset the industry and thus get their old power returned to them.

### Results

Black markets are coming back in and legal packers are shutting down, either permanently or temporarily, because they cannot meet this squeeze, while automobiles are going up \$50 to \$400 and bureaucracy is raising the wages of its employees.

Perhaps you are wondering why I continuously pound at bureaucracy. The real reason is that the taking away of our individual liberties and placing power in hands that have not earned it and are not qualified by experience or background to use it is to me the most dangerous emergency we face. It is insidious in its very nature. War is built up on a basis of "kill or be killed"; bureaucracy is built up on a basis of "give me power and I can protect you and give you everything," which is false on the very face of it. Price controls were again set up "for the good of all," and again you see what has happened!

\* \* \* \* \*

We are getting a sharp upturn in demand and price for replacements and feeder stock of all kinds. This has been a bountiful season. Feed is plentiful, and the opportunity is here to grow and develop livestock. This is a situation which the farmers of the Northeast have not had since the opening of the great range country. Now, the wheels have turned again, and apparently livestock really is going to come back into the Northeast. I have never seen the demand as general for all kinds of growing livestock as it is this early in the fall.

Livestock men from the Midwest and West are always appalled at the waste we continue to allow of our fall grasses and afterfeeds. Anyway, it has been a pleasant surprise to me this year to see and talk with so many who are doing or trying to do something about it.

This is not an invitation to go hog-wild or get over-stocked, but there is a world of grass, a world of cornstalks, and plenty of hay which, even if not good, can answer your feeding problem with a little added grain. Some years we do have early snows or sleet storms, which should be anticipated. By and large though, there is board and room for a much larger growing livestock population right here at home.

Write or phone today for descriptive literature.

To avoid delay  
Order NOW—today

## HOW TO KILL RATS

Simply put Black Leaf® Warfarin Rat Killer Bait in protected places where rats and mice can consume it regularly. They like it and literally eat themselves to death. Because other rodents are not warned, entire colonies are easily destroyed. Black Leaf Warfarin Rat Killer Bait is the amazing new rodenticide — WARFARIN — machine-mixed with special bait material that never becomes rancid. It's ready to use. Get it today and get rid of rats and mice the easy way.

### Also Available as Concentrate

When you prefer to mix your own bait, save money by using Black Leaf Warfarin Rat Killer CONCENTRATE. It makes 20 times its weight in rat and mouse killing bait.

## HOW TO KILL Chicken Lice AND Mites

Use this simple, easy, economical method. Apply Black Leaf 40 to roosts with the handy Cap Brush. Fumes rise, killing lice and feather mites, while chickens perch. One ounce treats 60 feet of roosts—90 chickens.

Tobacco By-Products & Chemical Corporation • Richmond, Virginia

# Make These for CHRISTMAS

By MABEL HEBEL

CHRISTMAS is coming with the speed of a jet plane, and here on this page and the opposite one are gift ideas that will help you to meet the big day with equanimity and joy—for it is a joy to give a gift that you have made yourself. As for equanimity, that pleasant state will be yours when you survey your finished gifts and realize that they cost you much less than if you had bought them in the stores. At the end of this article, you'll find directions for ordering the paper patterns and instruction leaflets for all of these designs. Prices run from 5 to 25 cents.

The cunning little panda, No. PC-5420, crocheted in single crochet in white and black Knit-Cro-Sheen, will delight a baby. Simple embroidery makes the features and cotton batting is used for the stuffing.

No. E-1816. A gay pair of mittens made in plaid and plain wool from your scrapbag. Easy and inexpensive to make.

No. PK-5895. Boy's classic cardigan, just right for school or play. Knit one for your "man of tomorrow."

No. PC-4832. A very pretty four-piece set for the newest baby. Bonnet, mittens and sacque are shown in the two pictures, top center. A carriage robe (not shown) completes the set. They're crocheted in group stitch and trimmed with dainty embroidery and narrow lace. Make one or all of these lovely looking pieces.

No. PK-5780. There's nothing a man likes better in the line of wearables than a good-looking hand knit sweater—so you're sure to please him at Christmas with this handsome

(Continued on Page 26)

PK-4831

E-542

836

(Far left) Pillowcases, guest towels or scarf ends are all the prettier with embroidered designs. Hot iron transfer pattern No. E-542 contains 6 motifs. 15 cents.

(Left) Colorful pot holders with rose centers are simple to crochet and make a welcome gift. Pattern No. 836 contains complete instructions. 15 cents.

(Far right) Crocheted edgings add to the beauty of handkerchiefs. Pattern No. 1008 contains four designs—pineapple, eyelet, Irish crocheted rose, and knot stitch. 15 cents.

(Right) From pattern No. 998 you can make knitted socks for lounging, or you may add soles and make slipper boots or bedroom slippers. 15 cents.

# WANTED—Your Opinion

By MABEL HEBEL

**E**DITOR ED EASTMAN shocked a lot of people by his recent editorial, "A Challenge to Women." In it he had the temerity to say that woman suffrage hadn't made a bit of difference in the quality of government we have, and that most women are not interested in getting better government—at least not enough interested to do anything about it. "Women's public housekeeping," he said, "is just not on a par with their private housekeeping!"

It's my opinion that women are making just as big a contribution to their communities as men are. Through their many fine organizations, they are slowly but surely bettering things. Others give unstintingly of their time and energy to the Red Cross, Hospital Aid Associations, Cancer Committees, etc. If men are doing more of that sort of thing, I would like to know of it!

(See editorial page for my answer to this!—Editor Ed.)

But I will have to admit that there are two ways in which I think women are failing in their responsibilities as American citizens. As a sex, many of us find it hard to take an active interest in government and politics, even locally. We know it is important to elect honest and capable men to public offices—but nine times out of ten we vote without any real information about the candidates.

The other, and even more important, way in which I think women are falling down is in teaching their children to

appreciate their democratic heritage. Good citizenship begins in the home. In Communistic countries, the minds of the youths are captured early. Why cannot American mothers give their children a love of our American heritage, an understanding of what it would mean to lose it, and a determination to preserve it?

According to the 1950 census, "the average American" is now a WOMAN, just past her thirtieth birthday, with a husband and two children. She is the key figure in the nation's chief line of fortifications—its homes. She has an enormous influence in determining the destiny of America because she is chiefly responsible for the development of her children's character. Will they grow up to be honest, God-fearing, hard working, freedom loving, tolerant, patriotic citizens, willing to assume responsibility and to help their fellowmen? Or will they grow up with the idea that it's smart to get "easy money," and that it's up to the government to take care of them from the cradle to the grave? Will they prize "freedom with responsibility" or will they prefer "security" with controls and regimentation?

On Dec. 1, AMERICAN AGRICULTURIST will publish its 4th Annual Forum issue, whose theme is all-inclusive—the individual's responsibility to his home, community, country, the world, and God. I would very much like to have letters from women readers discussing some of these important questions:

1. How can mothers help their children to become the right kind of American citizens?
2. What is your community doing to help the children in it to grow up into good citizens? What are you and the other women in your community doing to make it a good community?
3. What more can women do to strengthen the future morals of our country?
4. Outside of your family and home, what is your chief interest or activity?
5. What is your chief source of strength in meeting day-to-day problems?

I hope that I will hear from many of you within the next week or two. Please write to me at AMERICAN AGRICULTURIST, Box 367, Ithaca, N. Y. Your letters will be quoted in our Forum issue, and your name used unless you ask me not to use it.

— A. A. —

## Make These For Christmas

(Continued from Page 24)

V-neck pullover knitted in a rib stitch pattern.

No. PC-4408. Made in a jiffy are these cute slippers for a little girl. Crocheted in Knitting Worsted in easy single crochet and trimmed with colorful embroidered flowers. Directions come in size 1.

No. PK-4831. Pretty as well as comfy and warm is this cute little pom-pom-trimmed beanie with matching mittens, knitted in a cable pattern.

Nos. 998, 836, 1008, and E-542. See illustrations and descriptions on lower half of page 24.

No. 2313. This applique accented Dutch hat with warm mittens and muff to match will delight your daughter. Set comes in small, medium and large sizes.

No. 218. What little girl wouldn't like to discover this 35-inch-tall rag doll under the Christmas tree? Pattern includes clothes to dress it in.

No. 2467 includes two sew-easy ideas: a coverall style apron with pot-

holders, and a tea type for special occasions. Pretty and practical gifts.

No. 2880. Four pretty aprons that are fabric savers! Make some for yourself, too.

No. 225. Two toys in this pattern. Younger members of the family will love the soft Santa Claus doll, and also the horse's head attached to a broomstick for make-believe rides.

No. 3528. A complete wardrobe for a little girl's favorite doll. Quickly made and cut from a minimum of material.

No. 2318. Make this double-breasted wrap-around twice! First as a short length brunch coat, and again as a long length robe.

No. 2311. Easy-to-make and flattering nightgown and bedjacket ensemble.

### TO ORDER NEEDLEWORK INSTRUCTIONS ON PAGE 24

(Order the following needlework instruction leaflets from Needlework Department, American Agriculturist, 10 North Cherry St., Poughkeepsie, N. Y. Print name, address, numbers and names of patterns desired, and enclose payment in coins, check, or money order (no stamps, please). Add 15 cents for copy of our Needlework Book, the best value on the market! It is filled with designs for inexpensive gifts—and also contains several free patterns.)

No. PC-5420. Crocheted panda. 5 cents.

No. E-1816. Mittens. 5 cents.

No. PK-5895. Boy's knitted cardigan. 5 cents. Sizes 8, 10, and 12.

No. PC-4832. Baby's crocheted set of bonnet, mittens, sacque and carriage robe. 5 cents.

No. PK-5780. Man's knitted sweater. 5 cents.

No. PC-4408. Girl's crocheted slippers. Size 1. 5 cents.

No. PK-4831. Knitted beanie and mitten set. 5 cents.

No. 998. Knitted socks, bedroom slippers, or slipper socks. Sizes, medium and large. 15 cents.

No. E-542. Hot iron transfer pattern containing 6 motifs from 1½ by 12 to 4 by 14 inches with complete instructions. 15 cents.

No. 836. Crocheted potholders. 15 cents.

No. 1008. Crocheted edgings for handkerchiefs. Four designs — pineapple, eyelet, Irish crocheted rose, and knot stitch. 15 cents.

### Fun For Halloween!

**B**UBBLE, bubble, toil and trouble —and the most fun of the year if you give a gay Halloween party for your crowd! To help you plan it, we have prepared three pages of suggestions for decorations, refreshments, games and stunts. Write to American Agriculturist, Box 367-H, Ithaca, N. Y., and ask for "Fun for Halloween." Please enclose 3 cent stamp for mailing, and write your name and address plainly.

### TO ORDER PAPER PATTERNS ON PAGE 25

(Order the following paper patterns from American Agriculturist Pattern Service, Box 42, Station O, New York 11, N. Y. Print name, address, number and size of pattern, and enclose 25 cents for each pattern wanted. Add 25 cents for a copy of our new Fall-Winter Fashion book, filled with patterns for all ages, sizes and occasions, and many more gift ideas.)

No. 218—cut in one size. Doll (35 inches tall) takes 1¾ yds. 35-in.; dress, 1¾ yds. 35-in.; panties, ¾ yd. 35-in. Ruffling, 3½ yds. 25 cents.

No. 225—cut in one size. Santa Claus doll takes ¾ yd. 35-in. for body; ¾ yd. 35-in. for clothes. Horse takes ½ yd. 35-in. for head, ½ yd. 35-in. plastic for mane and reins. 25 cents.

No. 2311—36-48; size 36 nightgown, 3½ yds. 39-in. Bedjacket, 2¾ yds. 39-in. Edging, 6¾ yds. 25 cents.

No. 2313—small (size 4), medium (size 8), and large (size 12). Medium mittens, ¾ yd. 27-in.; muff, ½ yd. 35-in.; hat, ¾ yd. 35-in. Binding, 3½ yds. Applique included. 25 cents.

No. 2318—10-20; 36-40. Size 16, brunch coat, 4¾ yds. 35-in., 2¾ yds. ric rac. Long length robe, 4¾ yds., 39-in. 25 cents.

No. 2467—Small, medium and large. Medium coverall apron, 2¼ yds. 35-in.; 5½ yds. binding. Potholders, ¾ yd. 35-in. with ½ yd. 35-in. contrasting for heart applique (included). Tea apron, 1½ yds. 35-in., 3½ yds. ric rac. 25 cents.

No. 2880—cut in one size. None of the aprons take more than 1½ yds. 35-in. if one fabric is used. 25 cents.

No. 3528—please order by size for 14, 16, 18, 20, and 22-inch dolls. See pattern for fabric requirements. 25 cents.

## Retire?

### I'm Going to Have Some Fun!

In 8 more years I'll be 65. Then I'm going to do a lot of things I've wanted to do all my life—visit my brother, for example.

I might even retire. In fact, I can retire—on the comfortable income I'll be getting from my Farmers and Traders retirement policy.

You can do it too—if you start now. And you protect your family at the same time—all with one low-cost policy.

Mail the Coupon for Details.

**FARMERS AND TRADERS LIFE INSURANCE CO.**

Syracuse 1, N. Y.

## When There's Company!

In many homes it's quite a problem what to do about the children when there is to be company for dinner. At our house, we seat them at a small table. A card table does nicely, unless there are more than four children, in which case a drop-leaf table from some room in the house may be used. Or table leaves can be placed across smaller tables, or even boxes. If you have a folding screen, you can place it between the large "company" table and the children's table, and give both groups some privacy.—L. P. B.

*It's just what I've always wanted!*

Procter & Gamble's Exciting, New  
**CHEER**  
specially made for  
**"Tough-Job"**  
**Washing**

**You've never seen anything like it!**

New CHEER is Procter & Gamble's latest—the most exciting washday discovery in more than 100 years! And it's *specially made* to do "tough-job" washing *better* than any kind of soap you've ever used.

**Try it on toughest washing jobs!**

See how greasy overalls, grimy play clothes, hard-to-wash shirt collars and cuffs come *really clean* in hardest water. When you see how easily CHEER suds handle *dirtiest* clothes, you'll see why new CHEER gets *all your wash* so wonderfully clean!

**Safe for colors, too!**

With all its "tough-job" washing power, new CHEER is *safe* for colored washables, *kind* to hands!

**Prove it next washday!**

New CHEER does tough washing jobs better—gets clothes *cleaner, whiter*, in hardest water—than any kind of soap you've ever used! For CHEER's *extra washing power* not only removes grease and graying dirt but dulling soap film as well. TRY IT!

**Keep Cheer on hand! Get the Giant Economy Size Package**

Try **CHEER'S** New Patented Suds for "Tough-Job" Washing!

**Wonderful for No-Rinse washing, too!**

**Double-Your-Money Back...**

if you don't agree that new CHEER does "tough-job" washing better, gets clothes **CLEANER, WHITER** in hardest water—than any brand of soap you can buy.

# An Error of Diet

By GEORGE DUFF

(Reprinted from an old issue of the Dairymen's League News by courtesy of George C. Lee, Editor.)

YES," said the hired man, "Sairy Evans is what I'd call one mighty fine woman."

Hiram Woodworth grunted and sunk his fork deep into the shock of hay. Undoubtedly the widow Evans was a mighty fine woman, but he had as lief Bill Hurd did not mention her name with quite so much familiarity. Just lately he had noticed that Bill was prone to dwell upon the subject, and although the idea was absurd it might possibly be that the poor idiot had serious thoughts in that direction.

"I was comin' up by there last evenin'," Bill went on, "when she hollered to know if I wouldn't stop and help her catch a calf that had got loose. After we'd caught the calf, she invited me to set a spell on the steps, an' she brought out a pitcher of cider and some doughnuts she'd made fresh that day. Talk about doughnuts! Never see anything like 'em since I used to visit my grandmother when I was knee-high to a jack-rabbit."

Hiram grunted again.

"I've been thinkin'," the hired man stated, "that it wouldn't be a turr'ble bad scheme if one of us was to kind o' shine up to the widder and make a start towards gittin' somebody to keep house. Here you are a widower and me an old bach, an' trying to run three hundred acres and forty head o' stock with nobody in the house to even kindle the kitchen fire. Dummied if I ain't sick of livin' in that fashion. If it wasn't that I think a lot of ye, Hi, I'd 'a' left last fall and got a job somewheres where there was some-thin' more for grub than 'ud sicken a respectable hog!"

"Tain't very pleasant," Hiram admitted, "but what's a fellow goin' to do? I've hunted high and low for a housekeeper and offered all kinds of wages. There simply ain't any women left in the country any more. All gone to town to work in offices and shops. When I was a boy my mother used to hire for twelve shillin' a week, with plenty glad to get a job at them figures, but nowadays you couldn't find a girl that could boil water without burnin' it if you paid three dollars a day!"

"Ain't no women that wants to hire out," said Bill, "but maybe there's some left that would marry out if they got a good chance. It's been on my mind lately that there's got to be some marryin' done around this shebang or else let it all go to pot. My stomach ain't what it used to be, and dummied if I can stand it much longer on warmed-up potatoes and cold johnny cake."

"Huh," said Hiram, "thought I heard Doc Pease tell ye the other day

that you'd have to lay off rich food of all kinds."

"He didn't say exactly that. Said I couldn't eat fat pork and greasy gravy an' especially ice cream. Said ice cream was practically pizen to my system in the shape it's in, an' that's dodrotted hard, considerin' that I like it better'n a cat likes new milk."

"Well," remarked Hiram, "goin' back to the subject of the widow Evans, I've done some thinkin' along that line myself. Just about made up my mind, before you spoke of it, that I'd see what could be done in that direction. I'm goin' to start in tonight after chores, and just drop in on her occasionally on an evenin' and see how the land lays."

The hired man stared at him with amazement and disgust. "Why you poor old coot," said he, "she wouldn't pay no more attention to you than she would to a bunch o' whiskers on a bean pole! It'd be me she'd be interested in if anybody, and I'm pretty darn sure that the interest ain't all lackin' on her part right at this minute. You're too old to think of marryin' again, especially a young, lively woman like Sairy Evans!"

Hiram snorted with rage. "Too old, am I?" queried he. "You just watch out and see whether I'm too old or not! By ginger, just to show ye, I'll go over tonight an' start in courtin' her, and if you can beat me at the game I'll rent the place to ye and hire out myself for a farm hand!"

"Go to it!" urged the hired man. "You go over there tonight, and I'll go tomorrow night, an' we'll take turns off an' on and see who's ahead at the end of six weeks. After settin' through an evenin' with you, she'll see by contrast the next night what a real man is!"

During the remainder of the day the farmer and his assistant worked in grim silence. After the chores were done, Hiram donned his go-to-meeting clothes and made his way across the fields to the widow Evans' cottage, where he spent a pleasant hour discussing crops and cattle and destroying sweet cider and doughnuts. On the following evening the hired man arrayed himself in Sunday-best and departed across lots, and the next morning greeted his employer with a self-satisfied smirk and a personal inquiry.

"How'd you make out, night before last?" he asked.

"Make out with what?" demanded Hiram.

"How'd you come along with the widder? Said she'd have ye, pop off the reel, didn't she?"

"You mind your business and I'll mind mine," growled Hiram. "When

the time comes, I'll give ye notice long enough before hand so's you'll have some decent duds to wear to the weddin'."

As the double courtship progressed, however, the farmer found it necessary at times to assume an air of confidence that he secretly knew was without merit. He seemed to make little progress, his conversations with the widow being constantly led away, from subjects of deep personal import. Statements concerning his own physical and financial worth met with smiling acquiescence, but suggestions as to the desirability of a combination of fortunes brought about an abrupt change of the subject. He noted, too, that when he spoke of Bill Hurd in a deprecating manner, mentioning his many faults and few virtues, the widow smiled but made no reply.

"I ain't makin' any headway at all," he grumbled to himself as he trudged homeward across the fields after an unsatisfactory evening. "Dummed if it don't begin to look as if I'd have to get Bill Hurd out of the neighborhood 'r throw up the sponge. Wish I could think of some way to make him sick, so he'd have to quit work and go home to his folks for a month or two!"

At noon the next day, after an unsatisfactory meal of johnny cake and warmed-over potatoes, Hiram rose from the table and started in the direction of the pantry. "You just sit still a minute, Bill," he advised. "Got a little treat for ye today in the line of dessert."

He presently returned with a gallon freezer full of ice cream. "Pitch in," he urged, "and help yourself. Got Jay Stever's wife to make it for us, and after this I'm goin' to have it right along. Durned if I ain't tired of never havin' anything in puddings and pies, and if I can't get 'em I'm goin' to have a mighty good substitute."

"I hadn't ought to eat any of it," demurred Bill. "Doc says it's the worst thing in the world for me."

"Sho, 'twon't hurt ye," urged Hiram. "If a feller followed all the old grandmothers' whims about dietin' he'd be

## Laugh and Cry With George Duff

FOR nearly fifty years, ever since we were small boys working together in the farm fields or doing chores, my brother Fay (George Duffay Eastman, known to Dairymen's League News' readers under the pen name of George Duff) and I talked together about almost all the problems that troubled humanity. How right he was in most of his conclusions. Years ago, when the world was at peace, George Duff wrote:

"Don't lay aside your club with the idea that the Thousand Years of Peace are at hand. The world is better, some better today than it was yesterday, and very likely it will be better tomorrow than it is today. But the mill of the gods grinds slowly, and most of the grist is yet in the hopper."

As we grew up, my brother Albert and I listened while Fay told us stories from history and fiction with which his steel-trap memory was packed. My own ambition to become a writer was inspired by this brother, who could dramatize in either prose or verse the work and lives of country folks better than anyone else I have known. Soon after I became editor of the Dairymen's League News I prevailed upon Fay to write short stories for it, and from 1922 until his death on June 18, 1941, and long after I had left the News to become editor of AMERICAN AGRICULTURIST, practically every issue of the News carried his stories, filled with the pathos and humor of country life.

Paying tribute in the League News after George Duff's death, the late Ed Babcock wrote:

"He will always stand for the pathos, the humor, the sincerity and the shrewdness of country life. He knew his people and he loved them. Better than any contemporary writer he caught their spirit and perpetuated it in many a clever yarn."

The late Dean Carl Ladd wrote in the same issue:

"George Duff brought something to rural life that none of the rest of us could bring. His writings were original, interesting and inspiring. Within a great knowledge of local history, local people, American and world history, and the whole field of English literature, he was able to build a rural literature all his own."

The other day I re-read some of George Duff's stories from old volumes of the Dairymen's League News, and as I read them it occurred to me that nothing that we could print would be more pleasing to you readers of AMERICAN AGRICULTURIST than some of the best of Fay's stories.

We are deeply grateful to Mr. George Lee, editor of the Dairymen's League News, for permission to print some of these funny and dramatic stories of country life in coming issues of AMERICAN AGRICULTURIST, beginning with "An Error of Diet" in this issue.

## With AMERICAN AGRICULTURIST Advertisers

The **GOODYEAR TIRE AND RUBBER COMPANY**, Akron, Ohio, developed a new device for filling tractor tires with water solutions. It is known as the **Goodyear Water-Matic Valve**.

The **J. I. CASE COMPANY**, Racine, Wisconsin, has a little booklet they will be glad to send you which they call "The Pageant of Progress." It sketches the history of plowing, harrowing and harvesting throughout the centuries.

The new forage harvester and blower catalog of the **NEW HOLLAND MACHINE COMPANY**, New Holland, Pa., carries an oil painting of a forage harvester chopping grass. A copy will be sent to any American Agriculturist reader on request to the above address.

Do you have the coupon habit? Companies advertising farm machinery and supplies in **AMERICAN AGRICULTURIST** have many catalogs and booklets which they are glad to send on request. Many times for your convenience they use coupons which you can clip, fill out and paste on a postcard, thus getting the information you want in a minimum of time.

"Modern Controlled Irrigation" is the title of a new 16 mm. sound and color film offered for showings to farm groups by the **W. R. AMES COMPANY**. This entertaining 35-minute film tells the complete story of the distribution of irrigation water from source to crops.

Requests for free use of the film should be made by an authorized member of the group on the organization's letterhead, addressed to **W. R. Ames Company, 3905 East Broadway, Tampa 5, Florida**.

One of the tools recently made obsolete is the two-man crosscut saw. The tool that did it is the one- or two-man chain saw. For a copy of the booklet "How to Cut Costs and Make Money with Chain Saws" drop a postcard to **HENRY DISTON & SONS, Philadelphia 35, Pa.**

Youth activities at the 1951 International Dairy Exposition will be under the sponsorship of the Ford Division of the **FORD MOTOR COMPANY**. They are underwriting the entire FFA and 4-H cattle show and judging contest.

**JOHN REINER & COMPANY** of Long Island City, New York, is establishing a branch office in Syracuse, N. Y., at 726 West Hiawatha Boulevard. This concern manufactures diesel marine auxiliary units, diesel generating sets, and gasoline and diesel powered oil utility rigs. It is also a distributor for a variety of equipment useful on farms.

This is the new Ferguson 30 Tractor which **HARRY FERGUSON, INC.** of Detroit says "combines the durability and the power of the large tractor with the economy and durability of the light-weight type."

## FEEDING COWS WHEN THEY ARE DRY

(Continued from Page 8)

DHIA four years ago and we are making 100,000 lbs. more milk this year.

I've told what we have done to increase our production to our present level. Now I'll tell you what we could do to raise our production still further.

### Need of Pasture

We need more improved pasture to maintain our production at a high level during the summer months without excessive grain feeding. Having approximately 125 acres of permanent pasture, we should get a rotation started so as to make maximum use of the forage grown. A good percentage of our present pasture consists of nice, lush, soft moss that does not help produce milk at all. It's just a nice place to lie down and forget about eating.

Our roughage can be greatly improved through the seeding of legumes in our meadows; nearly all of our meadows are old seedings. Some parts have not been plowed in at least 45 years. Having hay of such poor quality, I suggested to Dad that we give each cow an extra dish of grain, and it appears to have paid off as our production during the winter months has been the highest we have ever had.

### Give Cows Space

Cows need ample room when stabled. We have just 32" between cows averaging 1,100 lbs. in weight. I sometimes think billy goats would fit better, but we have managed to get along. We have a large amount of udder injuries caused by the tight fit each year, giving us plenty of mastitis to fight. Cows should have 4' to 4'6" stall width to be comfortable. I have a barn plan of my own figured out and hope to see it carried out some time soon. It would give us 18 cows on 4' centers, and 16 on 4'6" centers. Other items that help raise production are quite numerous. Here are a few:

Water buckets should be at the cows' disposal. We have had them for about 25 years and wouldn't be without them. We practice fast clean machine milking. No hand milking. I have milked as high as 27 cows in 40 minutes with three machines. It "bushes" me but it's worth it. Milk at regular intervals; it really pays off. Irregular milking can cause a serious drop in production, and can and will cause mastitis in high producing cows.

If one really knows what faults his system of farming has and is really interested in correcting them; if he sets a goal in doing so, I can see no reason why anyone can't raise his production.

— A. A. —

## An Error of Diet

(Continued from Opposite Page)

appeared regularly on the dinner table. Bill complained of his stomach, grew languid in his labors, allowed that he was going into a decline with phthisis, but continued to eat ice cream. At last he approached his employer one evening with a request for a week off.

"Blamed if I ain't gittin' pretty well shot up, Hi," said he. "Maybe if I was to go home and lay up for a spell, I'd be all right for potato diggin'. Things ain't crowdin' very hard now, and a week or so over to Caldwell with the folks might help me and wouldn't hurt you none."

"Sure you can go, Bill," replied Hiram. "I'll get along some way, and if you ain't better in a week you can stay longer. Stay a month, if you want to."

On the evening following the hired man's departure Hiram sauntered across lots to the widow's home. Answering his knock an elderly and angular female appeared at the door,

who introduced herself as an aunt of Mrs. Evans.

"Sairy got me to look after things while she was gone on her weddin' trip," this lady stated. "Had to be somebody here, on account of the pig and the chickens."

"Her wedding trip!" gasped Hiram. "Why—why—when was she married?" "Ain't you heard? She an' Bill Hurd was spliced this afternoon, and they've gone over to spend the honeymoon with Bill's folks at Caldwell. That makes me think; Bill left a letter for me to give ye if you came over."

Hiram opened the envelope she handed him, and read dazedly the following epistle:

Deer Hiram:

Much obliged for that there ice cream dessert you fed me on. Up to the time

**IF THERE** is righteousness in the heart, there will be beauty in the character. If there is beauty in the character, there will be harmony in the home. If there is harmony in the home, there will be order in the nation. If there is order in the nation, there will be peace in the world.—A Chinese Proverb.

I begin eating it I didn't have nerve to say yes or no to mis Evans but it just put the ginger right in me. Can't do much cortin on potatoes and jonny cake but I hadn't been on ice cream diet three days before I begin poppin the question and kept at it till I got results. When you git over bein mad Sairy and I will come and rent the plaice and you can work for us as per agreement.

Hastily Bill and Sairy.

**It's Right on  
Your Foot, too!**

**TRADE  
MARK**

**BALL-BAND's** famous Red Ball trade-mark is the first thing to look for—in the store and on the merchandise—if you want to be sure of money-saving high quality in waterproof footwear for you and your family. As always, you can depend on **BALL-BAND** for long wear, for real comfort, and weatherproof protection.

Be sure to try the new *Liqua-Flex* footwear—another **BALL-BAND** development, lightest weight and most flexible of all Weatherproofs.

## Ball-Band Weatherproofs

# KERNELS, SCREENINGS and CHAFF

## AT HAYFIELDS

By TOM MILLIMAN

### GRASS CALVES ON PELLETS

**F**OR THE second year we are graining pasture calves by dribbling 20% protein cow feed in pellet form on grass, usually in a straight line as in the picture, although it really doesn't matter how the pellets are strewn so long as each calf has plenty of room in which to work. Calves unerringly find the pellets wherever they may be tossed in tall or short grass and will eat every one except those dropped in fresh manure.

Calves are notorious wasters of loose feed in troughs as can be observed from the buildup of ground on both sides of an outdoor trough after a few months of feeding. It can be estimated that pellets, in preventing spillage, yield a saving which much more than pays for the small charge for pelleting. But the reduction in feed wastage is not the main reason for pellet feeding of pasture calves.

### Run Them Together

For some years prior to 1950 we followed the custom of maintaining two calf pastures—one for the little fellows and another and larger one for the bigger calves. This was done to make sure that smaller calves had a fair chance at the feed trough and were not pushed away by larger animals. Without their share of grain, smaller calves fail to do well. The only solution seemed to be duplicate pastures, watering tanks, hay racks and salt boxes.

With the pellets, all calf pasture duplication is now a thing of the past; calves of varying size run together. Since the smaller ones can move as fast as their bigger sisters, and apparently eat almost as rapidly, I believe their intake of pellets is fully as much per hundred lbs. of calf. The larger calves are not able to use their greater size and strength to wrest more than their share of pelleted feed.

Relying on this limitation we have recently removed an 18-months-old dairy steer from the dry stock pasture and placed him with the grazing calves. Here he gets a little grain as a "warm up" to stall feeding in November, yet he cannot, try as he will, grab more than his share. According to his weight, he probably gets a little less.

### Provides Flexibility

Furnishing good grazing for calves isn't much of a problem in May and June, and sometimes in July. But by then the pasture has slowed up a great deal, and what was really too much at first turns out to be too little in late July, or sometime in August at the latest. More than likely the first batch of calves has been added to as those

in the barn reach grazing age. It is too much for most calf pastures!

The problem arises on how to insure for calves the cheap gains which only good pasture can provide, and at the same time keep the calf feeding chore on a convenient basis.

*It's a cinch with pellets. Move the calves to any field of aftermath or other pasture where grazing is lush, sprinkle pellets there once a day, and try tossing out a few pieces of baled hay once or twice a week, to see if it will be consumed.*

*Calves will eat less grain on such grazing than they did on the used-up calf pasture, and their "bloom" will come on gradually and surpass anything possible in barn or dry lot. It's pasture, rather than pelleted or loose feed, that does the trick. Cheapest and most satisfactory gain on the farm.*

Those who want pellets for grass feeding of calves, heifers, or steers are invited to ask their feed dealers for the service. It isn't available now, but should be.

### PEA HARVESTING SUMMARY

**T**WO months ago this page carried pictures and an article showing the great advantage of automatic pea harvesting over the methods of 40 years ago, still in use except that tractors have replaced horses. The Hayfields' picture showed five men engaged in old-style pea harvesting when all of them should have been haying and cultivating and would have been if custom harvesting had been available. The other picture showed an automatic harvester-elevator at work at Seabrook Farms in South Jersey, where two men harvest several times as many peas per hour as five men can do at Hayfields.

It was pointed out that with not less than two makes of pea harvester-elevators now on the market, the time had arrived for pea processors and contract growers to unite in making arrangements for custom harvesting, preferably by an independent operator who also does grain combining, etc. An invitation to speak up on this project was extended. A satisfactory response has been received. Many spoke personally about it and some wrote letters. All who responded were favorable to the development. Their attitude is well

illustrated in the letter of Sept. 1 received from Mr. H. H. Higley, R.D. 2, Medina, N. Y., who wrote:

*"Your article on pea harvesting hits the nail on the head. I grew a few acres of peas this year, the first in five years, and if I have to harvest them it will be the last for another five years. If I could have them harvested and trucked, I would be glad to grow 10 to 15 acres every year."*

Come to think of it, there was one dissenter to the pea harvesting article. He is Jim Sackett, our next-door neighbor on the East, who said the piece in AMERICAN AGRICULTURIST might be all right but a still better idea would be to grow no peas. Many farmers in pea country think the same as Jim does, and processors find difficulty in contracting enough pea acreage. Some companies, in dealing with farmers who want to grow sweet corn on contract, require that a certain acreage of peas also be grown. Sweet corn harvesting is now automatic and on a custom basis. Custom pea harvesting would help the situation.

### CHAFF

The elderberry provides "luxurious eating" beyond the dreams and out of the reach of Park Avenue millionaires, at no cost for growing. Never have there been pies to equal the spectacularly good taste of those made from the wild elderberry. In our neck of the woods these roadside and fencerow berries have been especially profuse and luscious in the late summer of 1951. Pies made from frozen elderberries are a tonic to be held off until late February and March. Then when the winter becomes tedious is the time to bring out the limited supply from the freezer. Spring will thereupon seem nearer.

Pheasants have almost disappeared in our vicinity. While the farm is no longer "posted," it having been found ineffective, uninvited hunters are apparently not the reason for the decline. Instead it would seem the scarcity of pheasants is due to increased numbers of foxes, weasels and other predatory wild life in a nearby swamp. High wages in Rochester and other factories and on farms too evidently have taken all available men and made trapping less attractive as a source of income than it was before World War II. A good inventory of fur bearing animals is building up to provide earnings for men and boys when regular jobs are once again fewer than the number of people seeking them.

For the 19th straight year, an extreme form of table luxury has been available. It is LUTHER HILL SWEET

These are the 1951 calf pellets for pasture. Because we could find on the market no ready-made large size pellets, regular 20% cowfeed was pelleted to order by a dog food plant and delivered to Hayfields. On a volume basis, pelleting should not cost over \$3 a ton extra, and nothing at all when less wastage is credited.

CORN, a tiny white ear growing on a diminutive stalk. The luxury comes from the unequaled taste, and also, because of very light yield and much heavier eating, more ground is needed than for the market varieties. In relation to those, LUTHER HILL is like the fabulously expensive and almost non-existent Prime Steer Sirloin Steaks compared to hamburger from an old dairy cow. The seed, having no appeal to commercial growers, is hard to come by, but if you'll send a postcard to AMERICAN AGRICULTURIST, you'll get one back telling where to get it.

"Bull strong and hog tight" is a slogan some fence manufacturer formerly used in his advertising. Posts, wire and labor are now scarce and expensive. Is it necessary to have fences good enough so that the cry of "cows in the corn" never comes? Or is it better to toggle up the old permanent fences each spring, as long as they will last, and depend upon electric fences elsewhere?

Speaking of bulls and fences, Goldy, the South Devon celebrated his sixth birthday last month all by himself, in a big pasture surrounded on two sides by rickety fences. The anniversary failed to disturb his equanimity or affect his gentlemanly reserve, and when he wasn't cropping the grass in great mouthfuls he alternated in gazing contemplatively over the fence at the cows and lying down with head held high in all the majestic dignity of his awesome size.

Our crop of heifer calves of grazing age shown eating pellets in their own pasture on August 17. From left to right, the 1st, 2nd, 3rd, and 5th calves had been turned out only two weeks before. Shifting these from barn to grass at age 6 months caused only a temporary setback, as can be observed in the picture.

A week later all 10 calves were transferred to a small field of ladino-brome-alfalfa aftermath, where the grain feeding was cut in half. Every animal gave thanks for better pasture by stepping up her rate of growth and beginning in late summer to put on the fall "bloom." See "Grass Calves on Pellets." A picture showing their appearance in late October will be run later.

## State Trooper Slayer Given 60-Year Term

ON September 13, ex-convict Matthew L. Armer was sentenced to 60 years to life for the murder of Corp. Arthur M. Diffendale of the New York State Police near Oneonta last June 14. Corp. Diffendale overtook Armer in a stolen cattle truck; and when he approached the truck, Armer shot him with a rifle, jumped in the truck and drove away. A short distance away the murderer abandoned the truck, which contained a stolen cow. Then followed one of the most intensive state-wide searches ever made. On June 24, Armer was arrested near his home at Nassau.

In a surprise move, 32-year-old Armer pleaded guilty to a reduced charge of second degree murder. He had originally been given a six-count, first degree murder indictment. Justice Bertram L. Newman immediately sentenced him to Attica State Prison.

The guilty plea was entered after two days of testimony by 17 of the prosecution's 46 witnesses. Because Armer had previously made no confession and because of lack of conclusive evidence that would insure a sentence of death in the electric chair, Prosecutor Frederiek W. Loomis agreed to accept the reduced plea. He pointed out that an adequate sentence on the

second-degree murder charge would serve the ends of justice and would keep Armer out of circulation the rest of his life.

— A.A. —

### \$100 REWARD

IF CATTLE rustling is to be stopped, prompt reporting of losses to State Troopers and Sheriffs is essential. Evidence sometimes disappears, and time permits thieves to cover up their tracks.

To encourage our readers to cooperate to the limit in catching thieves, AMERICAN AGRICULTURIST has increased its reward for information leading to the arrest, conviction, and imprisonment for at least 30 days of cattle thieves. For some years the reward has been \$25. From now until the end of the year it will be \$100. The \$25 reward for information leading to the jailing of chicken thieves is still in effect.

Claim for the reward must be made not later than the date of conviction. The reward goes to the one who gives the information. The cattle must have been stolen from an AMERICAN AGRICULTURIST subscriber who, at the time of the theft, had a Service Bureau sign prominently displayed on his premises.

## Farm Fire Insurance

THE risk of fire loss on farm buildings, equipment, household goods and livestock is relatively great. Therefore, practically all farmers insure their property against loss by fire.

Here are a few reminders about your fire insurance:

1. Is your insurance coverage in line with value of your property? Most policies run for several years. Values of farm property have increased. Have you increased your insurance coverage in line with increased value of your property?

2. Farmers are continually building new structures, improving some and removing others. Have these changes been reported to your insurance company and proper adjustments made?

3. Do you receive all the rate reductions due you because of fire protection measures you have taken? The policy of insurance companies varies on this point. Many of them will give you a lower rate for non-inflammable roofs, lightning rods, provision for adequate water, etc. If you have made some of these improvements, have you reported them to your company? The company ordinarily will not know about them unless you tell them.

4. Is your company giving you good service at a reasonable cost? The cost of insurance through a farmers' mutual company may vary considerably from year to year because of variation in losses. Therefore, the cost in a particular year should not be taken as a measure of the efficiency of a particular company. Instead the average cost over a period of years is a much better guide. During recent years the average cost of farm fire insurance through cooperative companies in New York State has averaged about \$3.00 per year per thousand dollars of insurance. Approximately \$2.00 of this goes to pay losses and \$1.00 to pay operating expenses. Does your company compare favorably with these averages?

5. Help prevent fires. The United States Department of Agriculture reports that fire losses on property insured by cooperative companies in New York in 1948 were \$2.11 per thousand dollars of insurance in force as com-

pared with \$1.83 for the United States. Five states had losses below \$1.00 per thousand. Fire losses in New York state are higher than average and much higher than in some states. Even if they were not, they are always too high.

Practically every farmer can take steps that will reduce the risk of loss. Everyone's situation is different but attention should be given to adequate electrical wiring, proper use of fuses, safe storage of gasoline, careful use of tractors and equipment around barns, safe storage of hay, good chimneys and good housekeeping.

—G. W. Hedlund

— A.A. —

Man's urge to invent is strong and it will probably continue as long as we maintain individual freedom which permits the inventor to profit from his contribution to society, both in satisfaction and in financial gain.

## Thousands of Eastern Farmers Now Work Warm and Protected with

## ...THE NEW AND FAR MORE POWERFUL FERGUSON "30"

All over America, farmers are witnessing the most amazing performance in tractor history!

Much of the greatness of the Ferguson "30" is due to the revolutionary Ferguson System. Some of it to a 20% increase in the power of its engine.

But the really outstanding feature of the Ferguson "30" is its *torque* performance (lugging power). This great lugging power pulls you through the tight spots with ease ... with no shifting of gears ... no stopping to "rev" up the engine ... keeps you going where other tractors quit!

And there are many, many more features of the great new Ferguson "30" to see and to discuss with your Ferguson Dealer ... features that give you far more value for the dollars you invest in your tractor. Telephone the Ferguson Dealer nearest you for a demonstration of the new Ferguson "30".

### \*TORQUE EXPLAINED

Ask your Ferguson Dealer for a FREE copy of "The Axe and the Wrench", the simple story of torque and what it means in your farm tractor. If your dealer can't supply it, write us at the address below.

THE FARM PAPER OF THE NORTHEAST

## Handy Poultry Practices

**L**ABOR-**S**AVING practices and gadgets on farms are common enough, but you seldom know about them unless you see them on the farm.

For example, on the farm of Jerry Stiles near Cortland, N. Y., ear corn is spread on the range with a manure spreader. The corn crib has a wire-covered bin on each side with a place to drive the truck in between for loading. The corn is put into the crib by an elevator.

In some cases farmers who raise corn for grain are using a hay drier to dry corn by merely piling the ear corn around the hay drier duct. Reed Brothers of Cortland dried seed corn that way and I am told that Ray DeHart of Cortland does the same.

Bob Usher who lives on Route 11 near Tully, New York, has about 1,700 "heavies." He once had leghorns but changed because of the increased return when he sells old hens. There is a nesting room in the center of a big pen. As a general thing, it seems that poultrymen are fairly well agreed that a community nesting box or pen is satisfactory for heavies but not so good for leghorns. Also that roostless pens are all right if pullets never get used to roosts. Once they do, it's difficult to change their minds. As they belong to the feminine sex, that's only natural!

There is a fairly common feeling among poultrymen that while the old floor-type ventilators worked pretty well they are not perfect, and the trend seems to be toward a

(Continued on Page 16)

These pullets on the farm of J. Edward Perry and son of Cortland Co., N. Y., have never been out of this pen. The heat for brooding is carried in pipes under the platform through the center, and these pipes are protected by the platform which is now used as additional floor space. No roosts are provided. The vertical pipes carry water for the hens.

Since Edward Perry changed from cows to hens he uses the old milk house as an egg room and stores the eggs in racks above the tank to prevent loss of moisture.

These pullets were started about August 1 by Leon Smith to be put in the laying house early in the spring. This room is an old basement cow stable. Leon supplied heat by the electric brooders shown, and he saves feed by putting the hoppers up off the floor on wide wire frames.

The egg washer on the farm of Jerry Stiles near Cortland. A thermostat keeps the water containing a detergent at the right temperature. Compressed air continually bubbling up through the water helps loosen the dirt.

## That Good

Each year about this time, farmers by the tens of thousands place their orders for G.L.F. seed. It is a custom of more than thirty years standing, and one that has proved profitable for farmers in this region.

These early orders enable your service agency to estimate accurately the requirements of the community, and to protect these needs in his order to the G.L.F. Wholesale Seed Department. When the orders from all the territory are brought together, the wholesale buyers can check them against their supplies, and, if they are short on any particular seed, order more of it immediately before the spring rush begins.

This cooperative system of seed buying not only protects farmers on price and supply, but has enabled G.L.F. to build, over the years, a

seed service which is a by-word for quality.

G.L.F. probably makes the best, most extensive and thorough private seed crop surveys in the United States. The buyers are well equipped with information as to probable production and its effect on prices. Buyers located at key seed production points spend their entire time contacting farmer producers and local dealers and working with contract seed growers. The volume which is assured by a

## G.L.F. Seed

substantial block of early orders enables G.L.F. to accumulate seed at carload lots at local points, and move it east at lowest freight costs. Modern cleaning and processing equipment located both in seed producing areas and in the East assures clean and properly treated seed.

All this adds up to a seed service which, year in and year out, delivers quality seed at reasonable cost to the farmers who use and own the service.

The seed order you place now is not binding upon you. You may make changes later if your plans change. So place your order now with your G.L.F. service agency and be assured of your supply of G.L.F. quality seed next spring.

Cooperative G.L.F. Exchange Inc.,  
Ithaca, N. Y.

# *Order Early and Protect Your Supply*

## What Can I Do?

By E. R. EASTMAN

**F**OR the past several years, in speeches and in articles and editorials in AMERICAN AGRICULTURIST, I have been emphasizing the dangers of socialism and the loss of our liberties which have meant so much to succeeding generations of Americans. In recent issues of AMERICAN AGRICULTURIST I expressed my disappointment that the women's vote has not made the world and America better places in which to live.

My whole purpose was not to be critical but to get people to be more alive to their citizenship responsibilities, for unless we take a more active part in all public matters, we surely are not going to be able to stop the downward trend towards a complete loss of our freedom.

I often hear someone say, "Well, I'm only one of 150 million people in America. What can 'little me' do?" The obvious answer to that is that if everyone took that attitude, democracy is doomed, and anyway there are many,

many things that every good man and woman can accomplish working either as individuals or as members of good organizations. So, in the next issues of AMERICAN AGRICULTURIST, under the title of "What Can I Do?" I will outline some suggestions and facts that can be used by individuals and organizations to aid in good public housekeeping, whether it be in the community or the state or the federal government.

The immediate problem before us right now is the coming annual election on Tuesday, November 6. Because this is an "off" year so far as most Federal and State officers are concerned, are you going to shrug your shoulders and tell yourself that "I just won't bother to vote this year?"

Now, in the first place, it is not an off year so far as the election of many local officials is concerned in many of our northeastern communities and, in particular, in New York State. In spite of all the changes of recent years, the government of your local city, village,

(Continued on Page 15)

## A. A. Cattle Rustling Reward Goes to Ward Tiffany

**N**O ONE will ever know why Corporal Arthur Diffendale stopped a truck near Oneonta on June 14. Probably it was a routine check-up. But without warning he was shot and instantly killed by the driver of the truck. This started off one of the most intensive manhunts of recent years. The search covered several Northeastern states. State Police and Sheriffs, and in fact all law enforcement officers, were determined that the crime of this cold-blooded killer should not go unpunished.

The only evidence was the truck which the killer abandoned and a cow wandering near by. This immediately brought the suspicion that the truck driver was a cattle rustler and pictures of the truck were sent broadcast in the hope that someone would recognize it.

Immediately, in an attempt to help solve this crime, AMERICAN AGRICULTURIST jumped its cattle rustling re-

ward to \$100 until January 1, and following the trial of Matthew Armer and his sentence of 60 years to life in Attica prison a check for \$100 was sent to Mr. Ward Tiffany, Route 2, Unadilla, N. Y. for his part in bringing Armer to justice.

Almost by return mail the following letter was received:

"I was very glad to receive the \$100 reward check for my part in tracking down the cattle rustler and the murderer of Corporal Diffendale.

"It certainly was a pleasure to receive a check from such a fine farm paper. I have read your paper for nearly twenty years and find it very helpful and interesting.

"Hoping your paper has lots of luck, we are

Yours very truly,  
(signed) Mr. and Mrs. Ward H. Tiffany."

The events which led up to Armer's  
(Continued on Page 27)

## YOU GOTTA GET A GLORY

You gotta get a glory  
In the things you do;  
A hallelujah chorus  
In the heart of you.  
Paint or tell a story,  
Sing or shovel coal,  
You gotta get a glory  
Or your work lacks soul.

And when you get a glory  
It is like the sun,  
And you can send it glowing  
Through the work you've done.  
O God, give me a glory  
And a workman's pride;  
For you've gotta get a glory  
Or you're dead inside.

—Author Unknown

## POULTRY IS BIG BUSINESS

"Those of us who live on the quieter side of forty remember very clearly when fresh eggs were to be found in the market only during the spring and summer. If we wanted eggs during the other half of the year, we had them only if we took pains during the flush season to store them away in jars of waterglass solution in a cool place in the cellar. . . .

"If there is any one man who stands out above others in leading the change in the poultry business from those days, not so long ago, it is Professor James E. Rice, affectionately known everywhere in farm circles as Jimmy Rice. As a farm boy, Jimmy found "beauty and symphony" in the homely cackling of hens. This music was to ring through his life while he strove successfully to lift poultry raising from a farm sideline to the status of a science."

—Dr. Herrell De Graff

WHEN one realizes that the average production per bird on almost any good poultry farm is well over 200 eggs per year, he gets some appreciation of the tremendous progress that has been made in poultry production in the last fifty years.

It is good to know, also, that the Northeast leads the Nation and the world as a great poultry section, where top scientific methods and hard work have developed it into a major farm enterprise returning an income to northeastern farmers second only to that of dairymen.

## WHAT CAN I DO?

YOUR attention is called to a new department in American Agriculturist starting on Page 3 this time entitled "What Can I Do?" The subjects covered in this department from time to time may help you to take a more active part as an individual in discussions with your friends and at meetings, on the important questions of the day.

## PRIZE FOR LETTERS ABOUT HOME FREEZER

AT OUR house we are so enthusiastic about home freezers that we wish everybody could have one. Until we had a freezer there was no satisfaction in raising our own beef, because it could not be satisfactorily preserved. To a lesser extent, the same thing was true for many fruits and vegetables. But now, nearly everything comes out of our freezer almost as good as when it was fresh.

You can be sure, however, that while freezing will preserve quality, it will not improve it. If you wait too long after picking to freeze corn, don't blame your freezer if the corn is not good. It's a waste of money to put inferior products into a freezer, or to wait too long after they are harvested before freezing them.

Home freezing is still in the pioneer stage. Almost everyone who owns a freezer has done some experimenting and found new and better ways to use it. We would like to pass your experience on to our readers, and so we will pay \$1 for every good

By E. R. Eastman

letter we can find space for in AMERICAN AGRICULTURIST on the subject, "How I Use My Home Freezer for Better Living."

Letters should be short and should describe any special ways in which you are using your freezer that you have found most satisfactory. Address letters to AMERICAN AGRICULTURIST, Department HF, Savings Bank Building, Ithaca, New York, and have them in the office not later than November 15.

## A GUIDE FOR YOUR FUTURE

IN A recent speech, James A. McConnell, General Manager of the G.L.F., made some points which appealed to me so much that I think they are worth passing on to you. Space does not permit printing his full discussion, but here are the high points of what he said:

In the first part of his address Jim made certain assumptions about the future, pointing out that of course they are not forecasts, just his opinions based on much reading and research.

1. He thinks that there will be no general world war.
2. That there will be no so-called explosive inflation.
3. That there will be no great deflation in the immediate future. In other words, the price level will be fairly stable, and the times will be relatively good in the next few years.
4. That some time in the middle 50's there will be a depression. This could be a bad one, or maybe not so bad and somewhat in the nature of a recession. Jim is of the opinion that an occasional recession like surgery, kind of tough to take but about the only way to bring our economy back in line when it is running wild.

Conceding that these assumptions may be correct, here is what Mr. McConnell would suggest you do to meet the situation:

1. Keep your debts down. It is a very good time to get out of debt and keep out of debt.
  2. Keep in a strong cash position so that you are not dependant on heavy borrowing to continue to operate.
  3. Don't let large inventories accumulate. This applies not only to business concerns and cooperatives, but to individual farmers. It means that it may be dangerous to carry too many high-priced cows, particularly if some should be culled. It means that you may want to think about too large inventories of feed, or about storing most of your crops when perhaps you ought to sell them in the fall.
- Summed up, these suggestions mean to just keep plugging away in a conservative way, being careful not to get too far out on a limb so that neither inflation nor deflation can ruin you.

## APPLES ARE A GOOD BUY

THIS FALL, apples are just about the best food buy on the market. Moreover, they are one of the very best foods. The Medical Society of Pennsylvania says:

Apples are tasty and good to eat.  
Apples also contain curative properties.  
These include tannic acid, pectin and cellulose.  
Apples are said to be of therapeutic value in some cases of dyspepsia, enteritis, colitis, dysentery, nephritis and typhoid.

In the Bible, in mythology, and in folklore, apples are recommended for the sick.

The apple was first used for specific ailments in Europe more than 100 years ago.

These early customs prompted doctors to consider the value of scraped apple in cases of stomach disorders.

For children suffering from diarrhea, doctors now prescribe an apple preparation made up in powdered form.

When I was very young, almost every northeast-

ern farm had its home orchard. Most of these orchards have disappeared, and rightly so, for it didn't pay to keep them up and they became a menace to other fruit growers if they were not properly sprayed and otherwise cared for.

But, unfortunately, with the disappearance of the family orchards thousands of farm families stopped eating apples the way they did when a panful appeared on most living room tables every evening. That is just too bad from the standpoint of good health, good eating, and your fellow farmers who grow the apples. With apples plentiful and low priced, let's start eating more of them.

## FERTILIZER DOES IT

ON THE hilltops near where I was born, the Clark Seed Farms grow potatoes to the tune of 600 bushels to the acre. That is amazing to me because we used to think we had a good yield on the same kind of land when we got 150 bushels.

There are of course many reasons for these increased yields, including better-yielding varieties and complete control of insect and disease pests. But the chief reason is the larger and more scientific use of commercial fertilizer.

Potato growers everywhere realize this, but I wonder if most other farmers do? For example, I am convinced that with the new hybrid varieties of corn and with a much larger use of the right mixtures of commercial fertilizer, properly applied, yields of grain corn on many farms here in the East can be at least doubled.

A recent survey made with 12 crops now grown on 46½ million acres in the northeastern states convinced a group of soil scientists who made the survey that the use of more fertilizer in this region "offers a new frontier equivalent to several million acres." For example, say these scientists, "if three times more phosphorus than is now used was applied to our grasslands, it would increase the yields 10%, which is equivalent to a million more acres under present practices. Forty pounds per acre of nitrogen would up yields of small grains at least one-third; similar results with some crops could be had with more potash.

## HANG TOGETHER OR ELSE

THIS YEAR there is more reason than ever for farmers to join their organizations and cooperatives and attend their local, state and national meetings. Statistics show that our farm population is rapidly declining. We are now only a small minority of the total population. The only way we can be heard is through organization and the voices of our good leaders.

Furthermore, there is a tendency on the part of some government officials to bypass rural farm organizations and their leaders and to have farm problems and business handled from the top down through centralized controls rather than from the farmers' grass roots organizations. The importance of joining up, attending meetings, and talking up cannot be over-emphasized.

## EASTMAN'S CHESTNUT

A MAN was perched atop one of Atlanta's highest buildings, contemplating suicide, and a policeman had made his way to the roof to try to persuade the man not to jump. "Think of your father and mother," pleaded the officer.

"Haven't any."

"Think of your wife and children."

"Haven't any."

"Well, think of what your girl friend might think."

"I hate women."

"All right, think of Robert E. Lee."

"Who's he?"

"Go ahead and jump, you damYankee!"

# AA's Farmers' Dollar Guide

—Reprinted from the New England Letter of the First National Bank of Boston

**THE CHART ABOVE** visualizes the stupendous increase in the number of civilian government employees who are paid by your taxes and mine.

The solid line shows U. S. population increase of nearly 50% in 30 years.

The dotted line shows non-government employment which slumped during the depression but which normally follows closely on population increases.

The broken line at the top shows government civilian employment which began to get out of bounds as government bureaucracy budded during the depression, and came into full flower in World War II. The natural expectation was that it would drop back to a more normal line after the war but the actual drop was slight and temporary. It now stands at nearly 250% of 1920 and has increased about 50% since 1941.

Never forget that Congress holds the purse strings and that you elect Congressmen. Bureaucracy can still be whittled down to size if we the people want it done.

**PLANS:** If you could look ahead with certainty you could plan easily. For the past year many plans for business and industry as well as farming have been made on the belief that prices would continue upward. In the last issue we stated that economists are becoming less sure that inflation will continue.

For one thing, building which is one of the big industries of the country is slacking off after a 10 year boom. History shows that building follows a 20-year cycle, increasing for 10 years and then decreasing for 10. Also there is a growing belief that industry can and will furnish defense materials at present rates and still produce what's needed for civilian consumption. In other words, shortages will be less common than has been commonly expected.

We mention this to suggest that you consider the possibility of level prices or even falling prices for the next few years, and that you keep in shape for a possible storm by avoiding heavy debt, and by paying off present debts.

**PROGRESS:** New information on farming is coming very rapidly. No farmer can afford to ignore this information. To keep up with the procession he must get the best available information quickly and then he must interpret it in the light of the conditions on his own farm. One place to get this new information is in the pages of AMERICAN AGRICULTURIST.

Here's an example: Pasture improvement is far from new but recommendations have changed and the costs of labor and lime and fertilizer are way above what they were a decade or two ago. Therefore, the farmer who concludes that better pasture will increase his profits must decide what fields will give him the best returns for improvement, what seed mixture is best on his farm, and how heavily he should lime and fertilize. This is a real job, but it explains why time spent in farm planning may give better returns than time spent doing physical labor. —Hugh Cosline

## The Song of the Lazy Farmer

**M**IRANDY can't quite understand why I don't hardly raise a hand to help around the place at all, and yet at hunting time each fall I'll tramp and climb and grunt and strain until my back's in awful pain. When I've worked myself to a nub and ask her if she'll kindly rub my aching muscles, she will say: "How come you lay around all day through winter, spring and summer too, insisting that you cannot do a lick of work because you ail, and then, come fall, you never fail to grab your gun and lose your head a-huntin' 'til you're almost dead?"

My gosh, I'd think that anyone could see that hunting's lots of fun; there's nothing will pink up your cheeks and make you feel first-rate for weeks quite like forgetting ev'ry care while you gulp in the crisp fall air and get clear off where you're alone, where you can feel the world's your own. It is an old instinct of men, which still shows ev'ry

now and then, that makes 'em want to match their wit with Mother Nature for a bit. Besides, a man will always find more fun in things of any kind which he does of his own free choice instead of at his master's voice.

## Cold-weather Battery Care

Gulf Batteries give you dependable starting on cold days and under the most demanding operating conditions.

**1. Make-up water should be added** to the battery just before using your equipment. This gives the water a chance to be mixed with the electrolyte by the charging current from the generator. If water is added and the battery left standing in freezing temperatures, the water may freeze just as readily as though outside the battery. When properly mixed and of the proper strength, the electrolyte will not freeze at ordinary temperatures.

**2. Keep fully charged** in cold weather. Battery efficiency decreases as tempera-

ture falls. At zero degrees F., capacity of a fully charged battery is only 40% of capacity at 80 degrees. A battery that has been allowed to drop to a specific gravity of 1.220 will freeze at -30°F. Maintain maximum power in cold weather by keeping your batteries fully charged.

**3. Insulation** (such as fibreboard) around the storage battery may be required under extremely low temperature conditions.

**4. Remove the battery** when you place your tractor in storage. Battery should be stored in a warm place to prevent freezing. Check it periodically and recharge if necessary.

## Reliable Starting

Want punch for sure-fire starts from your tractor, truck, or car? Then rely on a Gulf battery for the kind of performance you'd expect from a battery engineered for farm operating requirements.

The Gulf line of batteries—Power-Crest, Power-Par, Economy—is unsurpassed in dependability and quality...

**1. Engineered** to meet the exacting demands of each type of vehicle operation—tractor, truck, car.

**2. Built to give outstanding service** for all farm uses—more power and longer life.

**3. And every Gulf battery is fully covered** by a written warranty and adjustment agreement.

You get the assurance of dependable performance when you buy a Gulf battery.

## Ask your GULF man for GULF batteries

For thrifty farm power, remember to ask for these GULF FARM PRODUCTS, too... All-Purpose Farm Grease, Good Gulf or No-Nox Gasoline, Gulfube Motor Oil, Tractor and Truck Tires, and many others.

**against**

**HIDDEN  
HUNGER**

Good forage and good mixed feeds are no guarantee that **Hidden Hunger\*** won't strike at the health, production and reproduction of your herd. The greenest pastures often lack essential mineral elements. Grain varies widely in mineral content . . . the production demands of herds differ — making it impossible for commercial grain mixes to always provide complete protection against mineral deficiencies.

There's a good way to be sure that **Hidden Hunger\*** won't threaten your herd . . . and your profits. Feed MinRaltone—the proven mineral supplement—to be sure your stock gets 11 minerals known to be essential (plus Vitamin D), in adequate quantities and proper proportions.

See your Near's dealer. Let him explain what MinRaltone can do for your herd . . . how easily and economically it can be mixed with your feed at the mill. Write us for his name.

\*Hidden Hunger — lack of essential mineral elements needed by livestock for sturdy health, rapid growth, peak production and reproduction.

**NEAR'S FOOD CO., INC. Established 1899 BINGHAMTON, N.Y.**

Other Near's QUAL-ECON Products:

Dijextone — the balanced tonic

Milk-Saver\* — palatable, profitable calf food

45% Pig and Hog Concentrate\* — a complete balancer

\*Contain all minerals supplied by MinRaltone.

## Doorway to Safe Farm Financing

You'll find it in your own community — the doorway to your local National Farm Loan Association and Production Credit Association. Inside you can count on the sound, friendly service that is making Cooperative Farm Credit the choice of more and more farmers for all their farm financing.

# Heads Save Heels in Delaware County, New York

By G. H. SALISBURY

**S**IDNEY, N. Y., is justly proud of Scintilla's fine modern plant. Within walking distance of this bustling factory are numerous illustrations of modern devices and applications of agricultural science to which our community can also point with pride.

No longer is unfavorable hay-making weather the bugaboo it used to be to the dairy farmer. When the weather is not conducive to the older and time-consuming ways of curing and transporting hay, several of our area farmers cut their meadows and put grass into a silo. At the Wessels' Rockdale farm and at Fowler Finch's, enormous fans push air through mows of newly cut grass in the barns in order to cure it.

At Wessels' Bainbridge and Rockdale farms, at Yales' in Trout Creek, at Giffords' on the Deposit road, and at Ed George's at East Guilford, gutter cleaners lighten a necessary daily task.

## Six Foot "Furrows"

Near Unadilla on the Sidney-Unadilla road is the Mack Sawyer farm. An enormous rotary plow or roto-tiller, activated by a 100 horsepower motor and drawn by a tractor, pulverizes a six-foot-wide strip in the "plowing" on this farm. Mr. Sawyer also owns a stone-picker, with steel fingers capable of picking up surface stones from the size of your fist to as big as your head.

Ed and Bob George, East Guilford, use a subsoiler to break up the ground below the plow depth. This is calculated to drain the ground earlier in the spring and to hold moisture later in the season. Since the Georges maintain 45 head on 70 acres, they must make every acre count. They eliminate small grain from their rotation and seed down hay and pasture mixtures in their corn at the time of the last cultivation. After cutting the corn low, the stubble is knocked flat by tractor tires running down the rows. The Georges also clip pastures, divide them and rotate the herd from one pasture to the other.

John and Edwin Taylor, also of East Guilford, have a handy electric hoist to lift milk cans into the cooler.

Big business is represented in the agriculture of the region. The Wessel family, for instance, has 275 head of purebred Holsteins. From these they select a show herd and exhibit at all nearby fairs and at the State Fair. Other local dairymen who exhibit herds successfully are: Plankenhorn and Orton, and Maynard and Ralph Cole.

William Ostrander is also a successful exhibitor at County and State Fairs. His specialty happens to be Saanen milk goats. Last year at the State Fair he garnered \$52.00 out of the \$54.00 it was possible for his goats to win.

## Weed Killers

The railroads and the highway maintenance crews have used plant killers on the rights of way. Various farmers have used sodium arsenite as a weed-tree killer. This is applied to the cambium or growth layer. This year a few farmers are using selective plant destroyers—chemicals which kill certain weeds but do not injure the commercial crop.

Arthur Turtur of Masonville and E. J. Carr of the main road of Unadilla were users of a weed killer in corn last year. Wessels showed excellent results this year when the killer was sprayed on the ground after corn was planted but before it emerged from the ground. The control on yellow rocket and mustard is about 100 per cent. They regret they did not treat the soil for their 46

acres of picking beans. Carl Ferrara and Clifford Pratt treated 20 of their 59 acres of picking beans and find the control of mustard and yellow rocket almost perfect. The cost is negligible, being only about a dollar per acre for the chemical.

Hardly a dairyman in the area but what uses the wonder drugs penicillin, sulfa combinations and aureomycin.

## Bale Elevator

Crouch and Betts, when working together on Dr. Sweet's river farm at the covered bridge in Unadilla, developed a unique labor saver. A ramp was built on the hay baler which carried bales to a wagon towed behind the baler. This saved lifting the bales by hand to the wagon level and thus speeded up haying considerably. At this farm is another useful device. Pen stabling is practiced here. Naturally the floor level builds up. Home tinkering has developed an electric motor-operated silage feeding platform which can be placed at any level desired. It can be lowered and filled when convenient and then elevated out of reach of cattle until it is desired to feed them.

A unique agricultural business is that of C. G. Rooks of River St., who supplies poultrymen far and near with such potent chemicals as sulfaquinoxiline and diethylstilbestrol, as well as quaint electric guillotines which de-beak birds; goggles and blinders for chickens, and numerous hardware items.

Electric machines for plucking feathers from chickens are in use by Clifford Griswold, H. G. Von Kampen, and L. D. Tuller.

Clifford Griswold has an electric cable to speed up plants in his hot-bed. He de-beaks turkeys to prevent feather pulling which would permit sunburn on their backs and lower consumer demand. To level off seasonal work loads and consumer demands, he has a cooler with adequate capacity for such needs.

Most commercial poultrymen, and young poultrymen as well, are now chemically caponizing their broilers and fryers because of the superior quality of meat produced.

## Baby Chicks

In our general vicinity are the popular hatcheries of Ed Strobeck in Unadilla and J. S. Earl & Sons near Wells Bridge. The Strobeck business built up from a small beginning with quality stock and now produces thousands of White Leghorns annually.

The J. Stanley Earl & Sons farm is a well-balanced business with major enterprises in dairy cattle, poultry, lum-

## What Do YOU Think?

By JIM HALL

Farming Is Different In These Massachusetts Counties

**E**VERYWHERE I go in our Northeast I find there's something a little different about farming. For instance, on a recent trip to Bristol and Plymouth Counties, Massachusetts, I found that being so close to the big Boston and Providence markets didn't mean much to the dairymen because they couldn't even produce enough milk for their own counties. Bristol County with 365,000 population has more people than the whole state of Vermont, but the Green Mountain State has more cows than people, while Bristol County has only 16,000 milk cows on its 800 dairy farms.

On the face of it, it seems that they would expand a lot of the farms and start up a lot of new ones, but that's not so easy in an area where nearly all new fields and pastures have to be bull-dozed out of tree- and rock-covered landscape; and where former city dwellers are bidding up the prices of the land to a point where a farmer would rather sell his land in lots than to try and farm it in the center of a housing development!

Perhaps the very difficulty of clearing land is what makes these Bay Staters so painstaking in its care. On dairy farms I saw in Dartmouth and Westport townships, the meadows and cleared pastures were luxuriantly green in late September even though there hadn't been a drop of rain all month. Plenty of manure, ample complete fertilizer, regular clipping, careful rotation of grazing cows, and in some cases irrigation (although that wasn't used much this year due to humid conditions that offset the lack of rainfall) were all responsible. I didn't see a burned up pasture even down on Horseneck Road where in

places the pastures run right down to the Atlantic Ocean beach.

Better than half of the dairymen in Bristol County are descendants of Portuguese who settled in Massachusetts back in the 1870's and '80's. On the county's 400 vegetable farms, the percentage of Portuguese is even higher—about 75%. These grandchildren of Portuguese settlers are excellent crop men and good livestock handlers. Twenty years ago the vegetable growers started a crop in warm spring weather, and when it was harvested they were through farming for the year, so that they had to look for winter work. Nowadays, with new varieties, double and triple cropping, irrigation and storage facilities, they are kept busy selling the last of their crop until early December, and then start all over again in their plant houses about mid-January.

Irrigation is common on Bristol County farms; and in some areas, like in the vicinity of Taunton, city water for irrigation is piped to farmers even in the next township. The rate is such that it costs only about \$6 for an acre-inch of water—a bargain to these men who know what it means to have ample water when they want it.

Some of these Bay State farmers are diversified to take advantage of the type farming and the markets right in their own county. For instance, Joe Hass of Rehoboth finds profit in potatoes, poultry and pigs, and practices what's been called the most scientific feeding of waste in the Northeast. Joe spends a lot of time reading Morrison's *Feeds and Feeding* at night and then checks the weights of his hogs every 30 days to see which of his mixtures of stale baked goods,

IOWA  
Report No. 6683

# "I haul feed, pigs or cattle for under 2¢ a mile!"

—says Robert E. Perkins,  
Stockman, Bedford, Iowa

"My Ford truck cost little to buy, little to run, little to keep running," says R. E. Perkins. "Also, I get the power I need when I need it—on all kinds of roads!"

Bob Perkins was one of over 5,500 truck owners who entered Ford's nationwide Economy Run. He says:

"During the 6-month Run my 1950 Ford F-1 Pickup traveled 8,154 miles with many stops each day. Yet the total amount for gas, oil, maintenance (with no repairs) came to only \$154.29. That's a running cost of only 1.89 cents a mile."

Like others who rely on Ford for low running costs, Mr. Perkins is sold on the money-saving service he got from his Ford Dealer. For more facts on the trucks that last longer *and* save you money every mile—mail the attached coupon.

The '51 F-5 Ford with special stock rack is also a favorite of many stockmen. It is available with the 5-STAR Cab or, at added cost, the 5-STAR EXTRA Cab for more efficient driving and convenience. Big total gross

weight rating—up to 14,000 lbs. Single-speed or (at added cost) 2-speed rear axles with wide range of ratios for operating flexibility. Ford builds over 180 models. Your choice of V-8 or Six-cylinder engines.

*Availability of equipment, accessories and trim as illustrated is dependent on material supply conditions.*

## POWER PILOT HELPS STOCKMEN HOLD DOWN HAULING COSTS.

The Ford Truck Power Pilot is a simpler, fully proven way of getting the most power from the least gas. It is designed to synchronize firing *twice* as accurately. You can use regular gas... you get no-knock performance. Only Ford in the low-price field gives you Power Pilot Economy.

# FORD TRUCKING COSTS LESS

**because—FORD TRUCKS LAST LONGER!**

*Using latest registration data on 7,318,000 trucks, life insurance experts prove Ford Trucks last longer!*

TO TURN HER MILK  
INTO DOLLARS—  
**TURN HER CALF  
OVER TO KAFF-A!**

### The safe replacement for milk in calf feeding

**Don't waste milk on calves!** It's not necessary with Kaff-A! Low cost Kaff-A is an absolutely safe replacement for milk. When you feed Kaff-A, the milk your cows produce goes to the dairy—puts dollars in your bank account. Just 1 lb. of Kaff-A can replace up to 10 lbs. of milk in calf feeding. That means every 50 lb. box fed with low-cost hay and grain can release as much as 500 lbs. of milk you can sell! And that adds up to a handsome extra profit!

**With Kaff-A no milk is needed** after the 10th day. Kaff-A is tested, tried, proved a safe replacement for

milk. Two million healthy heifers have already been raised on it! Its dried buttermilk base is known for its nutrition. In addition, Kaff-A contains other dairy by-products, some cereal products, and plenty of Vitamin A and D Feeding Oil!

**Don't risk your calf's health** on inferior imitations of Kaff-A. A few pennies saved now may cost you many a dollar if your calf becomes a stunted cow. Feed Kaff-A and be sure that your calves get the nutrition that helps develop good milkers... good breeders! Get Kaff-A from your feed store or milk plant today.

## Vending Machines Open Whole New Market for Milk

On College Campus, In Offices, Factories and Filling Stations, Machines Have Found New Customers for Fluid Milk.

**T**HE relatively new milk vending machines are proof that consumers will buy good food when it is available. Cornell University School of Nutrition, under the leadership of Director L. A. Maynard, placed 5 milk vending machines on the University campus about a year ago, and these machines are dispensing as much as 15,000 half pints of milk a month. This is all extra consumption because the School has checked the regular eating places and cafeterias on the campus and found that there has been no decline in the sale of milk at regular meal hours. The milk vending machine studies, reported in a recent School of Nutrition bulletin, were part of the School's program of studying ways to better human nutrition.

A dairy company has put 16 machines on the Michigan University campus and is currently selling the equivalent of 10,000 quarts of milk a month, without cutting into the normal sales. A Rochester dairy has a battery of these automatic cows located in various plants and office buildings, and has found that American factory and office workers welcome the chance to drink milk when it is available. The machines are all operating on a profitable basis.

### Sales At Gas Stations

Few of us have ever thought of a gasoline station as an outlet for milk, but last summer an enterprising concern put two vending machines in a filling station on the northbound side of Connecticut's main highway, the Merrick Parkway, and two on the southbound side. Milk was dispensed in half pint cardboard cartons and, despite the fact that the operators were charging 15c apiece (60c a quart), these four filling stations sold 3,200 units in one 48-hour weekend.

In New York City a milk distributing company has installed in apartment buildings a machine that dispenses quart bottles. They do not release figures on their sales, but the operation is profitable, and it is easy to see why. Many of the apartment house dwellers in New York get their milk at the corner store on the way home from work. It certainly is much more convenient to step into the basement of the apartment house, drop a quarter in the slot and get out a quart of milk and 7 or 8 cents change.

Milk vending machines are of many types, including those that dispense the milk in glass, but the most modern in enclosed refrigerated machines dispenses the milk in cardboard cartons in various sizes, including half pints,  $\frac{2}{3}$  pints, and quarts.

The Rowe Manufacturing Company, a New Jersey concern, and one of the pioneers in the automatic vending machines, is making machines for milk, and they have it pretty well figured out that in order for a machine to make a profit, it should be located at a place where 300 people have daily access to it, because 25% of them will make a purchase, and 75 sales a day is profitable. However, they have found out that in certain industries where there is dust or peculiar odors, there is a much greater demand for milk. That kind of a location consequently takes fewer people to warrant the installation of the machine. The same company says that a man going into the vending machine business should have at least 12 machines placed so that there is not too much

driving between them for the serviceman.

While the man with the machines buys his milk delivered to the machines by a regular dairy, he still has to stop at each machine every other day just to make sure that it is spotlessly clean on the outside and that no milk has been spilled that will create a sour condition on the inside. We have been told that a man who has 12 machines and good locations and who is willing to work more than the usual 8 hours a day can make somewhere around \$9,000 or \$10,000 a year, less his traveling expenses.

### Create New Businesses

The milk vending machines are creating new independently-owned businesses, but more important than that, they are making available to many more people one of the most healthful, nutritious foods that can be purchased, and at the same time they are creating a brand new market for the products of our dairy farmers.

The Cornell School of Nutrition, pioneer in the research of practical use of the machines, put one in the McLean Central School which had no cafeteria or school lunch facilities for its 200 students, and the youngsters drank 150 units a day. The same machine moved later to a boy scout camp and sold 100 units a day to 125 boys and staff members, even though the boys had all the milk they wanted with their meals. At a Campfire girls camp with 90 girls, a large percentage again bought milk with the machine dispensing 62 units a day.

It seems to me that the machines are beneficial to everyone. The farmer has to produce more milk, which is sold to the fluid market, and the milkman has to make more deliveries, but this time to a machine instead of a front doorstep, and more and more people gain by its nutritive qualities, in many cases the milk replacing carbonated drinks.

And this isn't all that is in the offing as far as making good food readily available to consumers is concerned. Already there are trial machines dispensing such things as ice cream, eggs and cottage cheese, and I understand that there is at least one rather huge contraption that dispenses milk, eggs, butter, cottage cheese and other dairy products all from the one machine.

### Problems Solved

Some of the experimental dispensing machines were rather intricate, due to the need for their being refrigerated and for the need of a capacity big enough to last from one trip by the milkman to the next, and further complications arose when defective glass bottles broke when dropped a foot or more when the coin was inserted. The cardboard type containers have pretty well taken care of the breakage problem, but because they are not reusable, they present quite a storage problem, due to their bulk and light weight, to dairymen dispensing several thousand a day. Several firms are making and constantly striving to improve folding type cartons that will still work properly in the vending machines. When this type is perfected at a low enough price, milk handlers will be able to store hundreds in the same space occupied by a few of the non-collapsible type.

Machines are selling extra fluid milk where it was never sold before.

—Jim Hall

**Your STANDOUT  
for stamina and savings!**

**Pay less . . . Get More!**

Priced to save you money, with quality through and through. Chevrolet builds the lowest-priced line of trucks in America.

**Cuts Gas and Oil Costs!**

Chevrolet's great valve-in-head engine saves you money every mile . . . holds your costs to an absolute minimum.

**Gain on the Resale!**

Over the years, Chevrolet trucks have brought higher trade-in allowances than other trucks in their price field. Value is built in!

## Modern Farm Drainage

By E. C. MILLIKEN

IN THESE days of inflated prices and ever-increasing costs of operation, a farm drainage system is no more expensive than it was 40 years ago. This was brought to light recently in a comparative analysis of farm drainage costs made by Virgil Overholt, extension agricultural engineer at Ohio State University.

Mr. Overholt made his cost comparisons on the basis of what farmers have to sell. He pointed out that in the case of the beef cattle farmer, drainage is actually cheaper now than during the base period of 1910-1914. Forty years ago, a 1,000-pound steer sold for enough to install 78 rods of 4-inch tile. Today, this same steer would account for 143 rods. And in the case of dairy farming, fluid milk provides approximately the same amount of drainage in 1951 as it did four decades back.

Mr. Overholt also cited other significant comparisons. In 1910-1914, the farmer hauled his own tile from the plant, and his wife would furnish board for two machine operators. In numerous instances, the farmer supplied coal for the old steam ditcher used in those days, and he also boarded the ditcher's team. None of these problems is encountered today.

Perhaps the two important factors responsible for today's more efficient and thorough farm drainage are the service rendered by drainage contractors and the marked improvements in drainage materials and equipment. Years ago, a farmer had to string his own tile along the line, lay it himself and make connections. Hard pressed for time because of many other duties and chores, he was invariably unable to devote to the drainage job the time and effort necessary for a good, sound installation. Today, the farmer is relieved of this burden by the drainage contractor. The cost of these added services is not generally included in early accounts of drainage cost.

Quality of tile, Mr. Overholt states, has been greatly improved since the base period. He cites the appreciable

increase in the average crushing strength of most drain tile and the marked reduction in absorption, a factor that "means greater resistance to freezing and thawing."

Installation of drainage tile on the nation's farms has been further facilitated by the development of newer and better ditching equipment and the perfection of faster, more efficient installation techniques. Better metals are used for cutting surfaces, and improved bearings and better lubrication are provided. According to Mr. Overholt, "It is easier to follow an accurate grade with a modern farm trenching machine."

Several important factors that figure prominently in the 1951 farming picture were relatively inconsequential during the 1910-1914 base period. First of all, it is expensive today to keep a high-priced machine idle while waiting for land to become dry enough to work. The more hours farm machinery can be used, the lower is the cost per hour.

Using heavy machinery on wet land wastes power and increases the wear and tear on machines. Heavy farm equipment pulled over soft wet ground packs the ground and destroys good physical structure.

More legumes are grown now, and most of them are sensitive to wet feet. Farmers apply more commercial fertilizers than ever before, and proper drainage is essential to their effective utilization.

Mr. Overholt summarizes the results of various experiments, plus his own determinations and findings, as follows:

1. Tile drainage costs about the same today as it did 30 to 40 years ago.
2. Farmers get better drainage installations today.
3. Farmers benefit from more and better services from the drainage contractor and tile manufacturer.
4. With the advent of more heavy machinery and an increased use of legumes, farmers have more reasons to drain their land today than they did in 1910-1914.

# Selling Holsteins at Earlville

▼ A general view of the 269th Earlville Sale Aug. 29, 1951. Auctioneer is Austin Backus. Looking for bidders are Harold Lee, Charles Backus and C. B. Smith of Williamstown, Mich. At right of auctioneer, buyer is settling for a purchase.

**D**URING the past 28 years, Austin Backus of Mexico, New York, has managed 270 auction sales of purebred Holsteins at Earlville, N. Y. Nearly 34,000 Holsteins have passed through the sales ring and have gone to the highest bidders who, during this time, paid nearly \$9 million dollars to dairymen who consigned animals to Earlville.

It all started back in 1927 when Mr. Backus rented and later bought an old wagon factory at Earlville where the first sale was held.

"It appealed to me," said Mr. Backus "because at that time there were three railroads going through the town and Earlville is readily accessible for consignment of cattle from the counties in the State which have large numbers of registered Holsteins. At the same time it is accessible to buyers and consignors from Pennsylvania and New England."

More recently Mr. Backus bought an

◀ Jim Stone of Marcellus with a heifer consigned by him and bought by Robert Wilkins of Homer, N. Y., for \$500. Jim seldom misses a sale and figures he has sold at least 300 animals at Earlville since 1926.

▲ Where buyers settle. From left to right: Evelyn Hale, Theresa, N. Y.; Helen Shepard, Evans Mills, N. Y.; and Dorothea Smithers, Mexico, N. Y.

adjoining building which was once a milk plant and added it to the facilities of the sale. The pictures on this page were taken at a typical sale on August 29. Following that sale a brief report of it showing an average price of \$490 for 108 milking animals and a general average of \$439 for 155 head was sent to around 900 Holstein breeders. Along with the report there was an announcement of the next Earlville sale and blanks for consigning animals to that sale.

These blanks ask for considerable information which the Backus Pedigree Company of Mexico uses for checking facts, preparing a pedigree and print-

ing a sale catalog. When you consign an animal you are also expected to report any blemishes or imperfections, and after your animal arrives at Earlville it is carefully gone over by a competent veterinarian.

It is rare indeed that an Earlville sale fails to draw a good crowd. There are consigners, buyers and some who are looking for entertainment. If you are a new buyer and want credit it is a good idea to be ready to answer some pleasant but searching questions from E. J. Keane, vice president of the Merchants National Bank of Syracuse, and if you are there for entertainment rather than buying be careful when you wave your hand or nod to an acquaintance or you may have bid on a Holstein. The men in the ring are watching every minute for bids and a mere gesture or nod tells them that a buyer is ready to go higher.

Consigning Holsteins to an Earlville

sale is a privilege and not a right. The sales are conducted under a code of ethics adopted by the Purebred Livestock Association and "buy-bidding" on the part of the consignor or any of his friends is forbidden. In other words, when you consign an animal at Earlville you are expected to take what the high bidder offers. Any consignor who considers he is smart enough to get away with trickery of any sort is very likely to find that his consignments are no longer welcome.

Under our free enterprise system — and there is nothing more typically free enterprise than an auction—both buyer and seller are benefitted as should be the case in all sound business transactions. Purebred Holstein breed-

ers have learned over the years that here they have a dependable market. The consignor may not get as much as he hoped for in every case, but the fact that he comes back year after year indicates that on the average he is very well satisfied.

From the buyer's point of view here is an opportunity to see many animals, thereby saving much of the time it would take to see that number on the home farms. Furthermore, the buyer is protected by the code of ethics already mentioned and by the fact that the consignor does not get pay for his animal until registration paper transfers are ready to be delivered to the buyer.

▼ There is plenty of opportunity to inspect animals before they reach the ring. Here Jim Beiermeister, manager of Van Horne Farms, is looking over a cow consigned by John Krinker of Delhi.

## What Can I Do?

(Continued from Page 3)

town and school district is still highly important, and deeply affects your financial and social interests. In thousands of localities many local officers are up for election on November 6.

### Primaries and Caucuses Are Important

In the second place, in all rural communities of New York State, unless you go to the polls and vote on November 6 and enroll in the party of your choice, you will be unable to vote next April and next August in the primaries. In most cases, the primaries are more important even than the general elections. They will be particularly so next year, because it is a presidential year, and in the April primaries you will vote for delegates to attend the National Convention of your party, where the party candidates for President and vice-president will be nominated and your party platform will be determined. Will you send a hack politician as a delegate to your party convention or will you send a man who will truly represent you? You have the choice in the primaries, but again I tell you that you must vote this year on November 6 and enroll in your party or you can't vote next year in the primaries.

In the August primaries your party will nominate all other officers to be voted on later in the November elections. Of outstanding importance to you as a citizen are your representatives in the legislature and in Congress. Why not have a hand in nominating these men?

You as a citizen can blame no one but yourself if not more than six to ten people are interested enough to attend your party caucus, where the whole slate of local officers is nominated. In many cases, where either one party or the other predominates, the nomination is the same as an election. Therefore your vote counts more in your caucus or your primary than it does in the election. In addition to the important contests which will be held this year in many communities which require your attendance at the polls, there is also your sacred duty never to miss an opportunity to vote. Should you suddenly lose the privilege of voting, many of you who have not been in the polls in the past five years or who have never attended a primary or caucus of your party, would immediately go underground in secret meetings to get back your liberties, including the right to vote. But then it would probably be too late. The way to save the horse is to keep the barn door locked.

### Get The Facts

So, here is one thing you can do, and very soon. It is impossible for me to give you information about the political machinery on caucuses, primaries and elections in your particular state or community because there is so much variation. But you can get this information from the local branch of the League of Women Voters, which has organizations in nearly every county. You can get the facts from your county party leader, or from the newspapers.

Then, don't only vote yourself but help get out the vote. Urge your local organization—your Grange, your Farm and Home Bureaus, your cooperative—to urge its members to get out the vote. Call your friends and neighbors on the telephone. Ask if they are going to vote. Tell them why it is important. On Election Day, work again to get out the vote. **FREEDOM IS YOUR JOB!**

— A. A. —

Low engine temperatures should be avoided during cold weather, as too low an engine temperature means high fuel consumption, poor lubrication, spark plug fouling, crankcase sludge, and short engine life in general.

## Hundreds of Dairymen are taking Advantage of this Offer! \$1.89 Value DELTA Electric Lantern

More useful than a flashlight — hang this lantern on nail, etc. — work with both hands.

Handy size — big enough to give plenty of light, yet fits in coat pocket, tool box, etc.

Ideal gift — anyone would be pleased with this handy, useful lantern.

## Yours for Only 50¢ AND TAG FROM ONE 25 LB. BAG OF Peebles' CALF-KIT

(MILK REPLACEMENT)

## KIDNEYS MUST REMOVE EXCESS WASTE

Nagging backache, loss of pep and energy, headaches and dizziness may be due to slow-down of kidney function. Doctors say good kidney function is very important to good health. When some everyday condition, such as stress and strain, causes this important function to slow down, many folks suffer nagging backache—feel miserable. Minor bladder irritations due to cold or wrong diet may cause getting up nights or frequent passages.

Don't neglect your kidneys if these conditions bother you. Try Doan's Pills—a mild diuretic. Used successfully by millions for over 50 years. It's amazing how many times Doan's give happy relief from these discomforts—help the 15 miles of kidney tubes and filters flush out waste. Get Doan's Pills today!

## Cost of Raising Leghorn Pullets

IF YOU raise Leghorn pullets and want to sell them at various ages, how much should you charge? The formula in the table on this page may be a helpful guide to the approximate cost.

would be the total cost of raising a 4 week old Leghorn pullet in this example.

Instead of using the cost of labor, feed and chicks that were used in the

		Age in Weeks								
Item of cost	4		8		12		16		20	
Labor (minutes)	15	X—	21	X—	24	X—	27	X—	30	X—
Feed (pounds)	1.3	X—	4.5	X—	9.4	X—	15.2	X—	21.0	X—
Cost of chicks	1.1	X—	1.1	X—	1.1	X—	1.1	X—	1.1	X—
Other costs	15%	of Total =								
Total Costs										

In order to determine the cost of 4 week old Leghorn pullets, follow through this example, take the cost of the chicks of 40 cents and multiply it by 1.1= 44 cents which considers the mortality that has occurred. Add the cost of 15 minutes of labor multiplied by your labor rate of 75 cents per hour—19.0 cents. Next add 6.5 cents (1.3 pounds of feed at the current costs of 5 cents per pound). Total these three main items of cost; equals 69.5 cents and multiply by 15 per cent in order to cover other costs such as fuel, depreciation and litter=10.4 cents. This added to 69.5 equals 79.9 cents which

above example, substitute your own cost, and follow through the same as was done in the illustration. The same procedure will give you the approximate cost of 8—12—16—and 20 week old chicks. Of course your profit should be added. You can't make any money by selling at cost.

The feed consumption rates used are higher than are normally obtained from feeding trials. They were interpreted from data obtained from a survey of poultrymen by C. D. Kearl in 1947. Poultrymen often feed a few rats; and some feed is used by the chicks that die.—Wendall Earle, Cornell University.

## EXPERT POULTRYMAN COOKS THE BIRD

G. T. KLEIN, Extension Poultryman at the University of Massachusetts, is well known among Eastern poultrymen. He not only can tell you how to raise birds successfully, but can put an expert chef to shame preparing a tasty broiler for the plate.

At a chicken barbecue put on at the recent Worcester County (Mass.) Field Day in Spencer, Klein, decked out in a special chef's barbecue apron, helped the members of the Worcester County Poultryman's Association prepare around 2,000 half broilers for the hungry patrons.

The birds were removed from a waiting truck, laid out at the rate of 35 to the grill, and placed on the 75-foot cinder block barbecue pit over red hot coals. After an hour's cooking and five turnings of the grill, the broilers were ready for the plate. One Worces-

ter County poultryman spent the day spraying the birds with a regular barbecue sauce from a five-gallon tank.

Soon as Klein had given his okay to each individual half broiler, it was placed on a plate together with potato chips, cranberry sauce, milk and hot rolls, and passed out steaming hot to hungry customers at \$1.25 a plate.

A fence aided in keeping the hungry patrons away from Klein's home cooking, and when last seen this poultryman was sitting down to a plate of his own barbecued chicken with the other members of the Worcester County Poultryman's Association, who donated the proceeds of the barbecue to the Worcester County 4-H Camp.

—A.A.—

## HANDY POULTRY PRACTICES

(Continued from Page 1)

ventilating system operated by electric fans. One reason for the change-over is the fact that we now have fans that can operate continuously without danger of damage.

Bob raises quite a bit of corn, oats and wheat for grain. This is fed to the hens at the rate of 100 pounds of corn, 100 pounds of wheat and 50 pounds of oats. On this farm, built-up litter is used and this year Bob is putting in some sawdust as part of the litter.

Your neighbor poultrymen have worked out ways of saving time and money. Why not visit some of them some rainy afternoon? You will almost certainly find some ideas that will work into your own poultry operation.

—A.A.—

## THE NORTHEAST GROWS FOOD

Did you know that with only 3% of the nation's population and with only 5.6% of the farms, the Northeastern states produce:

- 11% of the nation's milk.
- 25% of the white potatoes.
- 11% of the eggs.
- 10% of the chickens.
- 21% of the apples.
- 66% of the shade-grown tobacco.
- 44% of the other cigar tobacco.
- 80% of the cranberries.
- 10% of the hay.
- 12% of the cherries.
- 76% of the maple sugar and syrup.
- 15% of the commercial truck crops.

—A. R. Gans in The Northeaster.

## BABCOCK'S HEALTHY CHICKS

MAKE GREAT LAYERS

A the 1950 Storrs Conn. Egg Laying Test our White Leghorns won first all breeds, with 3899 eggs and 4124.5 points. For the fourth time we won the high leghorn pen at the Georgia Test. Other 1950 records were good but not outstanding. In every test entered our Leghorns placed fifth or better. We still hold the all-time World's record for all breeds, all tests won in 1944-45.

WE HATCH THE YEAR ROUND  
White Leghorns, Red-Rock Cross, Rhode Island Reds and Barred Rocks. We own two hatcheries with 600,000 egg capacity, three poultry farms and 15,000 breeders. We carry on a complete pedigree-progeny testing program.

RETURN \$2.96 PER PULLET  
CHICK STARTED TO WIN...

the First New York  
Random Sample Poultry Test

Vancrest New Hampshires returned \$9.46 more profit per pullet chick started than the second highest entry. Their net of \$2.96 was more than twice the average return of \$1.28. In making this impressive record they were also:

- 1st for eggs per chick started;
- 1st for hen-housed egg production;
- 1st for livability among the "heavies";
- 1st for early maturity;
- 3rd for percentage of large eggs.

We also produce the Sex Link Cross

### MY EXPERIENCES AT CAMP MINIWANCA

I HAVE just returned from one of the  
finest experiences I have ever under-  
taken. Two weeks at Camp Miniwanca  
gives you training in a fourfold de-  
velopment. This is supposed to be  
social, physical, mental and religious  
training.

Each day I attended religious classes  
on the "Life Teachings of Jesus" and  
"Fourfold Development." The next  
class before dinner was "The Art of  
Creative Living" which was a type of  
philosophy. Meals were very good at  
Camp. One person from each table  
took his turn waiting on table.

After the meal was over there were  
a few minutes of free time which was  
usually devoted to tribe meetings. Ev-  
ery boy in Camp was assigned to an  
Indian Tribe which challenged other  
tribes in athletic events every after-  
noon.

My next classes were in "Social Hy-  
giene" and "Swimming." An elective  
course of two weeks' training in "Col-  
lege Adjustment and Leadership" will  
be very helpful as I plan to attend  
Alfred University this fall. After our  
evening meal there was a full even-  
ing's program until ten o'clock.

I returned home by plane which was  
a great experience in itself. My two  
weeks in Camp was fun and very help-  
ful. I would never have been able to  
accomplish this if it hadn't been for  
AMERICAN AGRICULTURIST. At this time  
I would like to say "thanks" from the  
bottom of my heart to every person  
who made my scholarship possible.

—Paul Hallinan, Tully, N. Y.

—A.A.—

### I ATTENDED WORLD ASSEMBLY OF YOUTH

I THINK one of the brightest spots in  
the news of this past August was the  
World Assembly of Youth Conference  
at Ithaca. Tensions in Korea, Iran,  
India, and a hundred other trouble  
spots were growing, but there on the  
beautiful Cornell campus, young repre-  
sentatives of 60 nations and of all races  
and creeds seriously sought ways to  
build a better world.

I attended the World Assembly of  
Youth Conference as a member of the  
U. S. delegation representing the Rural  
Youth of U.S.A. Conference. The 400  
representatives spent most of the WAY  
conference time considering the Uni-  
versal Declaration of Human Rights  
adopted by the United Nations in 1948.  
Our goal was to translate these ideals  
into practical suggestions and pro-

grams that youth, the world over, could  
follow up and use.

Plans were made for WAY subcom-  
mittees to sponsor and organize pro-  
jects of technical assistance to com-  
munities in under-developed areas.  
These might include small hospital  
units, clinical service, schools, etc.; in  
short, any service activity that could  
give tangible evidence of Young  
People's concern for a better world.

A forum on rural youth developed,  
with representatives from many parts  
of the world. They proposed that WAY  
establish a new subcommittee on rural  
youth affairs. The possibility of an in-  
ternational rural youth conference was  
considered.

To be sure, all was not sugar and  
sweetness at the conference. The lang-  
uage barrier was a big-trouble-maker.  
Sometimes our varied backgrounds  
brought confusing and conflicting ideas  
of the democratic way. At other times  
we wasted valuable time over proced-  
ural matters. We often wondered if our  
resolutions would really mean anything  
when we left.

But just the act of throwing together  
this heterogeneous group and letting  
us talk out some of these problems was  
more than worth the time and expense.  
We learned something of the differ-  
ences that background can give our  
perspective. We learned that replacing  
misconceptions with truth usually  
brings understanding. Best of all, we  
made a circle of friends that extends  
around the world.

I think the WAY conference was a  
grand display of young people's faith  
in the future, and I hope its work will  
continue. I hope that more rural-minded  
organizations will affiliate with the  
Young Adult Council, which is our na-  
tional committee of WAY. They need  
the backing and the steadying influence  
of our rural groups.

—Wilbur Pope, Adams, N. Y.

—A.A.—

### SAVING GARDEN TIME

I AM a farmer and gardener. I would  
like to have everyone benefit from  
some of my labor-saving ideas.

I plant my sweet corn about the  
middle of May, and as soon as it's up,  
I set out a new field of strawberries—  
one plant between each hill of corn.  
When I hoe and weed the corn, I also  
care for the berries in the same opera-  
tion, which saves me much time and  
labor. Then when fall comes, I roll or  
tramp the cornstalks down for winter  
mulch for the protection of the berries.  
In the spring I pull the cornstalks,  
which will loosen the soil and save  
cultivation. I then lay the stalks be-  
tween the hills of berries  
and they will hold the  
ripening berries up out  
of the sand. — W. N.  
Bradish, Star Route,  
Potsdam, N. Y.

Roland Edward Shaut of  
Avoca, N. Y., and one of  
the sows which he owns as  
part of his project in high  
school vocational agricul-  
ture. Roland is an Empire  
Farmer and at the annual  
FFA Convention at Malone  
he was elected secretary-  
treasurer of the State  
Association.

**RILCO** buildings on your farm will  
help make your work easier. They go up fast  
—stay up for decades—always look sturdy  
and prosperous—need little maintenance.  
They're Farm-engineered for maximum utility.

**RAFTERS** are made of selected,  
kiln-dried straight-grain lumber. They're  
bonded together under pressure with the finest  
of modern structural glues. They're continuous  
from foundation to roof ridge.

**CUT** and drilled for bolts with perfect  
precision at the factory, Rilco Rafters come to  
you complete with all connecting hardware all  
ready to put up. They need no inside posts or  
supports so your building goes up faster, with  
less lumber and less labor cost. Yet you get  
more usable space in any Rilco building.

**BUILDING** time goes fast when  
you work with Rilco Rafters. There's no time-  
wasting cutting and fitting on the job. Simply  
bolt each pair of rafters together with special  
ridge plates, raise them into position with a  
rope, bolt them to the sill or plate with special  
angle irons and metal dowels... then cover  
with siding and roofing. Many farmers build  
without any additional help.

**TIME** to see your Rilco dealer now, and  
get started on planning your new buildings.  
There are Rilco Rafters for every type of farm  
building. Your dealer can help you with plans  
and materials.

**ADDITIONAL CLASSIFIED ADS**  
 (Continued on Opposite Page)

By J. F. "Doc" ROBERTS

**L**IVESTOCK feeding for gain in weight and a change in quality is a different operation than it was just a few years ago. Now it is not limited to a few who can go into it on a load lot basis with high quality animals; it can be done successfully, and it should be, by every little farmer with just his growing animals.

When livestock was bringing five cents a pound, if one head or a group were fed for a gain of two hundred pounds, the increased return was ten dollars. Therefore, the animals fed had to get into a much higher quality class with its higher, per pound value in order to pay out. With low prices for livestock, only volume feeding of high quality animals could hope to pay the feeder.

### Surer Profits

Today, if an animal or group of animals is fed to gain two hundred pounds, the increase in dollars for the gain alone is forty to sixty dollars; i.e. twenty to thirty cents a pound. Then if the animal does well enough to get into a higher classification and therefore a higher price bracket, that adds to the forty to sixty dollars but is no longer essential for a profit.

Formerly, unless the animals put on feed were of superior quality and kind, and unless they showed a gain in price per pound over purchase cost per pound, they were almost sure to lose money.

Today, any animal that will gain three hundred pounds (cattle) or any group of animals (sheep or hogs) will bring a gain return of sixty to ninety dollars, and any man can feed almost any young growing animal under these conditions. This is particularly true if at least part of the gain can be made on grass or with grass silage or corn silage, hay and not too much grain.

Grain is another changing factor. Not the grain itself but what it will do for you, or not do. Through the two wars and under present conditions, meat to consumers has become pretty

largely meat. The public is no longer fussy about the quality of its meats. In fact the big demand now is for lean meat, yet no really good meat is lean. Many people today do not know what really good meat is or how to prepare it. Prepared meats or cow meats now comprise about 47 per cent of all the beef eaten. The Army, institutions, etc., are getting most of the steer beef now and have been almost consistently for the past ten years.

### Good for Northeast

This reflects on the Northeast very favorably. We are not great grain producers, and therefore we are not in a position generally to produce choice grain-fed animals. We do have an abundance of rough feed and some grain. We can now feed livestock in just that proportion, getting a low costing gain in weight on our animals and still be meeting the big demand from consumers. At present prices or prospective prices for livestock, this kind of feeding operation will make money whether you feed one animal or one hundred. We can also show this gain with the quality of animals which we now have, particularly if they are healthy and young. The only possible exception might be with some of the smaller types for their breed.

Feed for gain and weight is today's aim. An increased price through improved quality is good but not necessary, as it was just a few years ago. This makes any man with any feed and shelter a potential livestock feeder.

— A.A. —

### DUTCHESS ANGUS SALE

**T**HE most successful Dutchess County Sale in a long series of successful events was held last month at Mole's Hill Farm, Millerton, N. Y. Fifty-eight head of Aberdeen Angus heifers went to 34 buyers in 14 states at an average of \$1,976.

The two top heifers of the sale were both from Mole's Hill Farm and sold safe in calf to the 1950 International Reserve Grand Champion bull "Homeplace Eilcenmere 999-35." Lot 40 Mole's Hill "Esthonia 147th" was purchased by Esskay Farm of East Aurora, N. Y., for \$6,100 and Lot 46 Mole's Hill "Elba 217th" was purchased by Albert Heller of Brant Lake, N. Y., for his grandson, James A. Heller, as a start of a foundation herd for this young man who has not yet reached his first birthday.

The morning was taken up by an inspection of the cattle in outside pens and a unique program taking the many visitors behind the scenes in Dutchess County. All the consignors expressed themselves extremely pleased with the new sale management committee plan of which Myron Fuerst was chairman and the other members were: L. L. Leachman, William Landauer, and Theodore S. Ryan.

— A.A. —

### RAISE OR BUY?

Comments are frequently made relative to the comparative cost of raising dairy herd replacements or buying them. On paper it may be possible to prove that it is cheaper to buy them, but the hole in such figures is that many of the costs of raising are not "out of pocket" cash costs. Furthermore, many dairymen have found that raising replacements is one plank in a platform for maintaining a healthy herd.

There are certain areas where buying replacements is standard practice and doubtless is most profitable. Usually owners of such herds make no claim of following a breeding program. They buy animals, milk them out and dispose of them. But for the man who is trying to build a herd, raising his own replacements, is worth careful consideration.

— A.A. —

Breeding animals successfully is a combination of science, art, and luck.

## 300 REGISTERED HOLSTEIN CATTLE

**E**VEN before the holidays arrive, we begin to include the rosy-red cranberry in our mealtime plans. There is something about the deep red, juicy little balls of fruit that makes them seem to belong to winter. Everyone likes stewed cranberries, cranberry sauce, and cranberry jelly, but there are other ways to prepare the fruit that are perhaps even more interesting and good-tasting.

There is Cranberry Cobbler which rivals all other fruit cobblers you may have made. This dessert is hearty, so is best served after a light meal, but it's grand any time! To make it, simply dot your favorite baking-powder biscuit dough over cooked, sweetened cranberries in a rather deep basin. Bake for 20 minutes in a moderate oven, brown well, then spoon into dishes so that the luscious cranberry sauce forms the topping for the biscuit crust. Or try Cranberry Crunch or Betty for a change.

#### CRANBERRY CRUNCH

1 cup uncooked rolled oats  
1/2 cup all-purpose flour  
1 cup brown sugar  
1/2 cup butter  
1 1/2 cups cranberry sauce

Mix oats, flour, and brown sugar. Cut in butter until crumbly. Place half of this mixture in an 8 x 8-inch greased baking dish. Cover with the cranberry sauce. Top with balance of mixture. Bake 45 minutes at 350° F. Serve with vanilla ice cream, or whipped cream. 8 servings.

#### CRANBERRY BETTY

2 cups bread crumbs  
3 tablespoons butter  
3 cups apples stewed and sweetened  
Cranberry sauce

Melt butter and add crumbs, stirring well. Put a layer of crumbs in a buttered casserole, then a layer of apples. Dot each layer generously with bits of cranberry sauce. Add more crumbs

# It's CRANBERRY TIME!

By

Louise Price Bell

and fill the casserole in alternate layers as before, saving crumbs for top layer. Dot with butter and bake 3/4 hour in moderate oven, 350° F. 6 servings.

Instead of your regular salad dressing, try using a cranberry French Dressing on your holiday salads; 'twill make a hit and be very seasonal besides. It can be used on any fruit salad but is especially good on a peach-waldorf one made of peaches, apples, celery, nuts and watercress.

#### CRANBERRY FRENCH DRESSING

1/2 cup salad oil  
1/2 teaspoon salt  
1/2 teaspoon sugar  
Dash of cayenne and paprika  
1 teaspoon lemon juice  
1 tablespoon cranberry juice

Pour salad oil from bottle into bowl, add seasonings and beat until blended. Add lemon juice and cranberry juice slowly, beating all the time. Serve at once, or, if allowed to stand, beat just before serving.

Here are some relishes that you are sure to like:

#### CRANBERRY-APPLE RELISH

1 lb. cranberries  
2 large apples  
1 orange  
Rind of 1/2 orange  
2 cups sugar

Wash cranberries, apples and orange. Core apples and peel half the skin from the orange, remove seeds. Put cranberries, unpeeled apples, orange

Cranberry Crunch is a dessert treat, with a bright red layer of sauce baked into the pudding. For special times, add a scoop of ice cream or whipped cream.

and half the rind through the food chopper. Add sugar and stir until sugar is dissolved. This is perfect with poultry or meat and in chicken and turkey sandwiches, so don't feel badly if you have some left over . . . which I doubt!

#### CRANBERRY-GINGER RELISH

1 1/2 cups orange  
1 1/2 cups cranberry sauce  
1/2 cup raisins  
3/4 teaspoon powdered ginger

Put orange, rind and all, through food chopper. Blend with whole cranberry sauce, raisins and ginger. Place in refrigerator several hours or overnight for flavors to blend.

#### CRANBERRY-MINCE RELISH

1 1/2 cups cranberry sauce  
1/4 cup chopped walnuts  
1/4 cup mincemeat

Crush jellied cranberry sauce with a fork. Stir in the mincemeat and nut meats. Makes 1 pint relish.

## Plays for Home Folks

**I**F YOU went to the New York State Fair last month and didn't find your way to the little theater in the auditorium of the Women's Building, where one-act plays were put on five days in a row—admission free, you missed one of the best things at the Fair. The afternoon that I was in the audience I saw "Three Cheers for Woody," put on by the Vanguard Players. It was so good that I sat through two performances of it.

One of the interesting things about "Three Cheers for Woody" was that

it was done with practically no properties. The audience easily imagined doors, walls, a cigarette lighter, hammer, nails, a picture, and other properties. In fact, some of the imaginary "props" in the play were a lot more effective than real ones would have been. This particular play was a good example of one of the aims of the State Fair Theater—to show people how to put on a play easily and inexpensively.

Three rural groups, three community theaters, three college groups, and one industrial group were the

players. They included the Community Theater of Syracuse, East Clay Grange, Excelsior Theater of Navarino, Fredonia State College Mimmers, General Electric Park Players, Ilion Little Theater, Liverpool Theater Guild, Utica College Gaslighters, Vanguard Players, and the Westford Home Bureau.

Each day two different groups presented a play twice, so that there were four performances daily from 5 to 7:30 p.m. Running the whole show was a young man named Herbert Smith who has been State Fair Theater Director

By MABEL HEBEL

for the past two years. Daily demonstrations of how to put on stage make-up were given by Mrs. Herbert Smith. Another young couple, the Sydney Freemans, assisted the Smiths and helped to man an exhibit where you could get advice on how to put on plays; also, free lists of plays and other helpful material.

At least 5,000 fairgoers saw the plays. Some of them hesitated at the door of the auditorium and asked, "How much does it cost?" They couldn't believe it was free! The New York State Fair is probably the only State Fair in the country that gives its midway this type of competition—free entertainment for home folks by home folks, plus expert advice in putting on a good play the easy way.

The idea of a State Fair Theater originated with Professor A. M. Drummond of Cornell University, who back

### NEW YORK STATE FAIR THEATER PACKS 'EM IN!

in 1918 took a group of Cornell students to the Fair and put on plays that were so popular that the "Standing Room Only" sign hung out continuously. Four years later the theater was discontinued for want of a place

# Along the South Hill Road

## The Last Harvest

By INEZ GEORGE GRIDLEY

THE garden is bare except for a few cabbages squatting in a weedy row. Most of the leaves are off the trees. Even the marigolds in the bed sheltered by the house are scorched with frost, but there is a deceptive warmth to the air. Two-year-old Linda and I hurry to get through our morning chores so we can pick up hickory nuts.

Early as we are, the gray squirrels are there before us. I have often wondered if squirrels are as provident as they are cracked up to be. These grey squirrels may be very busy canning food for winter, or stowing it away in a deep freeze, but they seem to be having a continual party in the tree tops. They are shouting back and forth, and showing off by swinging from the tips of tiny limbs. Refreshments are being served all the time and they have all put on weight enough to frighten a dowager. Occasionally they take time off to shake a reproving finger at Linda and me and harangue us in squirrel language. If translated, I'm sure it would be:

"Don't take ALL the hickory nuts! Leave a few for us!"

### Hickory Nut Frosting

There are so many ways to use the sweet nuts. Our favorite ways are in 'boiled' fruit cake and in a special cake topping that Sister, the teen-ager in our family, likes to make. Take one cup of sugar, one cup of sour cream, and one-half cup of chopped hickory nuts. Boil until chewy, and pour without stirring over a plain loaf cake. It has a nice creamy glazed look, and a little tang that adds just the fillip you need to a plain cake.

Our basket is almost full and Linda is tired and is begging, "Take me, take me, take Ninny!", so we leave

the basket for Brother to bring in after school and trudge back, with Linda riding piggy-back:

This is the last sweet harvest of the year.  
Potatoes are drying in the cellar bins  
And apple barrels burst with Northern  
Spies.

The brittle husks beneath my moccasins  
Give their sharp fragrance to the chilly  
air.

The hickory nuts are scattered on the  
ground

Like small bleached bones among the  
fallen leaves.

The north wind has a cold, insistent  
sound,

Shaking the shoulders of the stubborn  
trees.

Gray squirrels scold and one last mourn-  
ing crow

Warns me to hurry, hurry, gather all I  
can!

The gray sky thickens and I feel the  
threat of snow.

— A. A. —

### CHOCOLATE CAKE CONTEST COUNTY WINNERS

WITH the finals in our New York chocolate cake contest for Grangers just a little over a week away, Pomona Granges are winding up their county contests. Names of five more county winners have been reported to us:

#### POMONA WINNERS

COUNTY	GRANGE	WINNER
Dutchess	Rock City	Mrs. Ernest Jones
Franklin	Chateaugay	Mrs. Ben Willis
Livingston	Scottsburg	Mrs. Scott Traxler
Madison	Georgetown	Mrs. Leona Goodrich
Seneca	Fayette	Mrs. Ethel Hartranft

In all, 53 county winners will compete in the finals at State Grange annual session in Syracuse, N. Y.

## Winning 4-H Club Sewers

MISS JOAN ORTMANN of Hurley (at left in picture), Ulster County, was judged state winner among 100 contestants in the annual State 4-H Club Dress Revue at the New York State Fair.

Miss Ortmann won an all-expense trip to the National 4-H Club Congress in Chicago this November. A senior at the Hurley High School, 17-year-old Joan is the daughter of Mr. and Mrs. Walter Ortmann. Her winning dress was a green cotton print with reversible coat and bolero of navy cotton.

Chosen alternate was Miss Ann Fisher, 18, (at right in picture), daughter of Mr. and Mrs. Bernard Fisher of Canastota, Madison County. She is a sophomore at Cortland State Teachers College. She modeled her party dress of puckered nylon sheer with black velvet accessories.

The 100 girls who modeled in the revue received blue ribbons as State blue award winners. They were selected from 409 girls who participated in eight district revues earlier in August.

# They're Growing Up!

## No. 2: Appearance is Important

By EDWARD V. POPE and MARION K. STOCKER

*The second in a series of articles on problems of teen-agers and how parents can help their children meet these problems.*

Every teen-age girl can't look like a movie star—but she'd like to!

**C**HILDREN under 10 don't care much how they look. They are popular with the gang because they're good athletes or good sports, rather than because they're handsome.

But as they enter adolescence (that's roughly the age period from 11 to 21) your Mary and Johnny will, sooner or later, become very much concerned about their appearance. Their bodies change obviously and rapidly in the early teens as they turn into men and women. They have more freedom as teen-agers than they did during childhood and are more in the public eye. But mostly teen-agers care how they

look because they begin to want to attract the opposite sex; and that's perfectly natural.

During their teens, then, Mary and Johnny not only have to get used to their changing looks, but also they must learn to accept the fact that certain of their characteristics will always be with them; that they always will have a big nose, or a receding chin, or a body that is shorter or taller than the average...

Unfortunately most young people want to look like movie stars; and when their appearance differs sharply from what they consider ideal, Mary and Johnny can be so self-conscious that they are miserable. At 15, crooked teeth, straight hair, or protruding ears can be a tragedy.

As understanding parents, though, you can do a lot to help your children over this difficult period. In the first place, you can tell them in advance about the bodily changes of growing up so they will be prepared when the changes happen and not be frightened. You can explain these changes as something to be welcomed because they bring new privileges as well as new responsibilities.

Second, you can help Mary and Johnny to look their best. Have their crooked teeth straightened by a dentist, if you can afford it. Nothing adds to self-confidence like knowing that you have a pretty smile. If over-weight or a poor complexion are problems, urge

the children to cut down on sweets and fats. Serve them meals with plenty of fresh fruits and vegetables and meat—but meals which are low in fat-building calories.

Also, let Mary and Johnny dress according to their size rather than according to their age. Let Mary have a permanent wave and let her use some lipstick and powder, even if such things weren't done at 14 when you were a girl. Make sure that Johnny's clothes have plenty of let-down space at the cuffs. It's awfully hard to feel at ease when you've grown so fast that your wrists and ankles hang out of your clothes.

Finally, you can teach your teen-age son and daughter that appearances aren't nearly so important as their attitude toward appearances. Everyone's body changes continually from babyhood to old age. The changes are evidence of growth and should be seen as sign posts to new adventure, not as stumbling blocks to happiness.

You can teach these things by example. Your attitude toward the wrinkles, gray hairs, and a thickening waistline which begin to come with middle age will be an important factor in the children's attitude toward their own appearance. If you refuse to rebel against the inevitable, Mary and Johnny too may decide that life holds too much of interest to waste sleep over freckles or skinny legs or a too-big nose.

## Plays for Home Folks

(Continued from Page 20)

to put it, but two years ago State Fair Director Harold L. Creal revived it, with Prof. Drummond as advisor.

Believing that home talent shows and amateur dramatics are one of the best ways for farm organizations and other groups to "get the crowd out" to meetings, or to raise money, or just for the fun of neighbors working together in a creative activity, AMERICAN AGRICULTURIST has for years encouraged the putting on of plays by rural and small town groups. So now we give a big, big hurrah for the New York State Fair Theater, which we believe will in time become one of the most popular features of the State Fair.

One way in which AMERICAN AGRICULTURIST has encouraged play production by amateur groups is in making available good rural-life one-act plays that are inexpensive, easy to produce, and royalty free.

A new play on our list is "Hen-pecked," a one-act farce about a husband who is terribly henpecked until his old girl friend comes to visit and arouses his wife's jealousy. There's also an amusing Home Bureau skit, and a very funny play called "The New Hired Hand." In it the new doctor, an eligible young bachelor, calls at the farm of the Widow Green and gets mistaken for her new hired hand, until it all ends happily in a romance.

With Christmas coming, you will probably want our delightful play, "Christmas on the Farm." Our list of plays gives further details about these and other good plays. To get the list, just write to AMERICAN AGRICULTURIST Play Department, Box 367, Ithaca, New York, and enclose a 3-cent stamp for postage.

## NIGHT-SONG

By Elaine V. Emans

Lord, this has been as good a day as I  
 Could ask, for did it not contain, for  
 trouble

Come unexpectedly, faith to apply  
 To it until it vanished like a bubble?

And was there not the sun I loved, and  
 wind

Upon the face, and friendly conversation;  
 A dog's affection, warm, undisciplined;  
 My work to do, and time for relaxation,  
 Good food, and loveliness to feed the soul,  
 And kindness evident, and time to read,  
 And music strangely tempoed to my need?  
 And was there not in me, throughout the  
 whole

Day, Lord, a glowing which time fails to  
 dim

Or render commonplace—because of him.

## HONEY WEEK IS COMING

With National Honey Week coming soon, store shelves will be filling up with the new season's sweetness, and you'll want to lay in a supply.

**Honey Butter** is delicious on bread, and easy to make. You just blend 1/2 cup of butter with 1/2 cup of honey; beat thoroughly and store in refrigerator. More honey may be used in proportion to the butter if you want a thinner spread.

For a healthful homemade candy, make:

### Honey Chocolate Almond Drops

8 squares (1 package) candy-making chocolate

1/4 cup sweetened condensed milk

1/4 cup honey

1/4 teaspoon salt

1/2 teaspoon almond extract

Blanched almonds

Heat chocolate over boiling water until partly melted. Then remove from

boiling water and stir rapidly until entirely melted. Add condensed milk (which should be at room temperature), honey, salt, and flavoring, and stir until well blended. Drop from teaspoon on waxed paper. Place 1/2 blanched almond in center of each candy. Chill in refrigerator or let stand at room temperature several hours, or until firm. Makes 5 dozen small drops.

## Four Pretty Handkerchiefs

**L**OVELY embroidery designs give these hankies a delicate touch of charm. Why not make several to give as Christmas gifts? Enclose 5 cents in coin with your request for instruction sheet No. PC-5613, and address Needlework Department, AMERICAN AGRICULTURIST, 10 North Cherry St., Poughkeepsie, N. Y. Write plainly name and number of instruction sheet, and your name and address.

# Easy to Wear

**No. 3088.** Pansy potholders—matching the pockets—make this panel coverall apron even more practical. Sizes small, medium, large, extra large. Medium, 2½ yds. 35-in., ½ yd. contrasting, 8 yds. ric rac.

**No. 2565.** With a scalloped shawl collar, this brunch coat is so smart looking it can double as a house dress, too! Note the wide range of sizes. Sizes 16-20, 36-50. Size 18, 4¾ yds. 35-in. fabric.

**No. 2497.** Easily-made ensemble of three pieces in corduroy or plaid, or dress-up velveteen. Sizes 2-8. Size 4 princess jumper and buttoned jacket,

2¼ yds. 35-in. The blouse, 1¾ yds. 35-in.

**No. 2389.** Shoulder pleats for action-back ease are an extra feature of this convertible collar shirtwaist. Choice of sleeve length, button or zipper front. Sizes 12-20, 36-44. Size 18, 4¼ yds. 39-in.

**TO ORDER:** Write name, address, pattern size and number clearly. Enclose 25 cents for each pattern wanted. Add 25 cents for our Fall-Winter Fashion Book which has pattern designs for all ages, sizes and occasions. Send to AMERICAN AGRICULTURIST PATTERN SERVICE, Box 42, Station O, New York 11, N. Y.

## Tasted at the Fair

NO one had to ask directions to the handsome kitchen installed on the first floor of the Women's Building at the New York State Fair this year. Tempting smells of good things simmering on the stove and baking in the oven made it only necessary to follow your nose. Much of the cooking was done by Mrs. Stephen F. Sweetland of Cazenovia, N. Y., and Fair visitors did the tasting. According to Mrs. Sweetland, the two most popular dishes she made were her Green Tomato Pickle and Baked Beans. Here are the recipes she used:

### GREEN TOMATO PICKLE

4 quarts green tomatoes coarsely ground or chopped  
4 large onions  
4 cups brown sugar  
4 tablespoons salt  
2 cups vinegar  
2 tablespoons celery seed

Wash tomatoes and remove stems and any spots; drain and chop or grind coarsely. Slice, chop or grind onions. Mix all ingredients together, bring to a boil, and cook slowly for 4 to 6 hours, until of right consistency. Seal while hot in sterilized jars. Yield, 8 pints.

### BAKED BEANS

2 pounds dry beans  
4 slices (about ¼ pound) salt pork or bacon or ham fat scraps  
2 tablespoons salt  
½ cup brown or white sugar  
Black pepper

Cover beans with cold water and bring to a boil. Add salt pork, or bacon, or scraps of ham fat, and salt, and cook beans until tender (usually 2 to 2½ hours, depending on age of beans). When beans are tender, add the sugar. Turn into 3-quart baking dish, place fat on top, and sprinkle with black pepper. Bake 30 minutes or until brown in hot oven (400° F.).

If you ask Mrs. Sweetland how many servings you will get from this recipe, she says: "It sort of depends on how well the folks like beans, and how keen the appetite is. Many times I've seen my family of six, plus a hired hand or so, completely finish a 3-quart casserole at one meal. Of course if you figure one-half cup as a standard serving, a 3-quart casserole of baked beans makes 24 servings." So you bake your beans and let your family determine the number of servings!

## Mayville Woman First-Prize Winner in Grange Cooking Competitions

Three-time cooking champion praises Active Dry Yeast

Mrs. Olga Stratton of Mayville, N. Y., was a first-prize winner not once but three times in 1950. She took first place in cooking contests at her local Grange, the Pomona Grange, and finally the State Grange Contest . . . where women from all over New York competed!

Relatively new to the ranks of prize-winning cooks, Mrs. Stratton joins her fellow-champions in praising Fleischmann's Active Dry Yeast. "I know I can count on this Active Dry

Yeast," she says. "It gives me grand results . . . so quickly and easily."

Who can resist delicious goodies made with yeast! Their rich, nourishing goodness will delight the whole family. When you bake at home, use yeast. And be sure you use the best—Fleischmann's Active Dry Yeast. It's so fast—fast-rising, fast-dissolving! So easy to use! Get several packages of Fleischmann's Active Dry Yeast today.

# SHADOW

By GEORGE DUFF

(Reprinted from an old issue of the Dairymen's League News, courtesy of George C. Lee, Editor.)

HARRY was really gaining a little, Joe Perkins reflected, looking across the dinner table at his hired man. To be sure, the white weal on the young man's cheek still showed, as it always would show, but the redness that rimmed both his eyes had faded until it was scarcely to be noticed. The short, hacking cough that bothered him so much when he first came was not so bad now. He still coughed, once in a while, but when he came to hire out he had coughed pretty steadily.

Really, he had not hired out. He came along and stopped and wanted to know if Joe needed any help, and Joe told him that a farmer almost always needed help but most always had no money to pay a man. Then Harry said that the pay wouldn't be anything great, because the man in question was practically no good except to tinker around and do chores and whatever else a durn worthless skunk could stand it to do.

"Seems as if I've seen you before," Joe had remarked. "Didn't you use to work over in the First National Bank at Hampton, along sometime before 1917?"

"That's me," admitted Harry. "I went away and was gone a good while, and when I came back another fellow had my job and they didn't want me any more."

Curious, thought Joe, stirring his tea at the dinner table on a spring day of 1920. Queer enough, that God and the world could do such things to a fellow like Harry. Such a clear-eyed, handsome boy, over at the paying teller's window at the bank, and then cut with shrapnel and choked and blinded with gas and just kept alive for years in hospitals, and coming along at last to beg a job working for his board.

"There's a shadow social up at the church tonight," observed Joe, stirring his tea at the dinner table. "Let's you and Ma and I go up, Harry, and kick up some fun."

"Haven't any money," Harry replied. "I've got just a dollar, and when they got to bidding on shadows they'd run beyond my finances pretty durn quick."

"I'll see that they don't," offered Joe. "I've got ten that you can have just as well as not."

"Not for me, old boy," stated Harry, getting up from the table. "You know durn well that I don't half earn my board and the spending money you give me for cigarettes and the like."

"Probably you might get a chance to bid off our school teacher," urged Joe.

"I'd be foolish to try," said Harry. "I haven't any illusions about my looks, or about that alleged dress-up suit of mine."

That was the way of it, thought Joe. Harry might get over the physical hurts, but the soul of him, the spirit and the hope and the natural reactions of youth were broken and done. Twice a day that tall, slender, very lovely girl who taught the school just below went tripping by, to and from her boarding place, and every day she waved to old Joe or called out a merry greeting. Once, too, she had waved a little diffidently to Harry, standing in

the barn doorway, and it looked to Joe as if Harry had started a motion to wave back. But then of a sudden the young fellow had stiffened very erect, clipped his heels together, and raised his hand to the brim of his old hat in a very respectful, very exact and precise army salute as if to a superior officer. Then he turned abruptly away, and after that he kept out of sight when the teacher was going by.

"I'll plow a while this afternoon," said Harry, and reached for his jacket on a nail behind the kitchen stove. "It won't hurt me to drive team on the wheel plow, if you'll let me try it."

"All right," said Joe, "but you better make up your mind to go to the social with us."

"No, I guess not," said Harry. "You and Ma go along and have lots of fun, and I'll stay home and keep the pup and cat from getting lonesome." Then he started out, and then all of a sudden dear old Ma got up and started towards him with that kind of a soft-yearning look in her dear old eyes that used to be there and Joe used to love to see before their baby boy died, and she put her arms right around Harry's neck and held him tight, and she said, "Harry," she said, "won't you go up to the social with us?"

And then all of a sudden right there before Joe, Harry's arms went around Ma and he held her tight, and his face, that was so young but so grim and scarred, all softened and broke up until he looked like the gentle boy that he had been.

"Why, sure I'll go, Ma," he said, and

hugged her tight. "Why, sure I'll go, if you want me to."

There was quite a crowd in the church annex, and the women had hung a sheet across one end of the room and when it got dark they put a kerosene light on a table a few feet beyond the sheet, and the men and boys gathered out in front and everything was all set. Henry Borden, who was a good auctioneer and a good fellow and always glad to help, placed himself just outside the sheet and announced the sale. There was, he said, necessity of raising a considerable sum to pay the minister's salary, and the women and girls would come one by one between the lamplight and the curtain and have their shadows auctioned off to the highest bidders, and whoever bought a shadow would be entitled to eat supper with the shadow's principal and out of a box that she had provided.

Then the shadows began to appear on the curtain and the bidders started to bid. Joe Perkins picked up a couple of elderly maidens at a bargain, and was perhaps a trifle disappointed when, according to custom, they came in front of the curtain to be identified after sale. Then a dozen more articles were auctioned off, and the bidding slackened a little as the market came towards being supplied. And then a shadow appeared—tall, slender, lovely in contour—that Joe Perkins immediately identified.

"It's Teacher," he whispered to Harry. "It's our girl down below, and I hope they'll bid her up good!"

"Yeah!" replied Harry, indifferently. "Yeah, don't worry. Some of these young bums whose dads have got lots of money will run her up sky-high."

His prophecy was correct. The alleged young bums with lots of money started her at a dollar, ran her quickly to five, to six, and hesitated on six dollars and fifty cents. Then in that moment of hesitation, punctuated by the auctioneer's calls, the slender, graceful shadow executed a movement of military drill. It right-faced to front the audience, clipped its heels together and brought a hand up in precise correct salute.

Harry gasped, close at Joe's should-

er. "You got that ten with you?" he whispered suddenly.

"Sure," replied Joe, "any time you want it."

"Eleven dollars!" said Harry; not loud, but with a ring in his voice that might have been in it just before they choked and shot him down in a rush through French woods. And maybe it was the size of his bid or maybe it was the ring in his voice, but anyway there was no more bidding.

She came out, when the shadow sale was over, with lunch for two all fixed up in a pretty box tied with ribbons, and walked straight to Harry.

"Hello, soldier," said Teacher, and her pretty kind eyes looked right into his poor eyes that had been reddened with mustard gas.

"Soldier? Where do you get it?" said Harry, but his eyes looked right back in hers unabashed, and his scarred face softened just as it did when Ma put her arms around him.

"I had two brothers in the 42nd Division," she answered. "One of them died close up to the works at St. Mihiel."

\* \* \*

Which, taken altogether, might explain why, in this spring of 1939, Harry and Teacher live on Joe's farm, and Joe and dear old Ma live down at the village and come up to see them 'most every day. Also it might be given as reason for the existence of a young Joe, now almost a man grown, and a twelve-year-old lassie named after Ma, whose other name was Emma, and a very small prodigy, scarce knee-high to a grasshopper, named after a boy who sleeps close up to the works at St. Mihiel.

—A.A.—

## WHAT DO YOU THINK?

(Continued from Page 8)

market garden surpluses and green alfalfa is the most profitable. He isn't as interested in putting the weight on fast as he is in putting it on for the least cost. They tell me it's amazing how many cull tomatoes his 80 feeder hogs will eat in a day!

Plymouth County's farming is something different again. They have dairies—some mighty good ones—and poultry and vegetables, but the number one crop is, of course, their cranberries. On 10 or 11 thousand acres of bogs they produce around 400,000 barrels of the popular berries, which brings them in from 6 to 10 million dollars a year. Farming in these bogs (they range in size from little patches to over 100 acres) depends almost as much on water as it does on soil. For instance, if a light frost is expected, they open sluiceways and fill the ditches surrounding and bisecting the bogs. If the frost is to be heavy, they raise the water still higher so that it is all around the roots of the plants; but if a killing frost is expected, they raise the water level right over the whole field!

While kinds and ways of farming vary all over the Northeast, I find one thing besides hard work that is common: The most successful farmers are those who are quick to make use of new research developments and who plan through sensible mechanization and good management to produce the most per hour of labor.

Would you rather farm on high priced land right at the markets or have lots of reasonably priced land distant from markets? What do YOU think?

—A.A.—

Twenty-five years of timely, tested, delicious recipes in AMERICAN AGRICULTURIST, all collected in one cookbook—THE AMERICAN AGRICULTURIST TREASURY OF COUNTRY COOKERY. You can get a copy for \$1.95. Write to AMERICAN AGRICULTURIST, Box 367-CB, Ithaca, N. Y.

### SLIM AND SPUD

### Spud's Got a Problem

DEAR READERS  
HAVE YOU ANY SUGGESTIONS AS TO WHAT SPUD SHOULD DO? IF SO PLEASE SEND THEM TO THE EDITOR OF THIS PAPER

CONT.

**ORKIL, INC.** of Higganum, Conn., is enlarging its Cutaway Harrow Division and has named the J. S. Woodhouse Company of Brooklyn as Northeast distributors. The Higganum plant is one of the few in America which makes all parts of a harrow even to the disks. In the plant the latest in factory equipment has been added to experience gained in 86 years of continuous harrow production.

Available at your New Holland farm machinery dealer is a 44-page handbook "How to Grow Grass for Profit." In this booklet the latest available information on grass has been brought together.

The Wisconsin Alumni Research Foundation, P. O. Box 104, Madison 1, Wisconsin, has prepared an excellent demonstration manual on rat and mouse control for use by 4-H, FFA, and FHA club members.

It describes the use of warfarin (discovered at the University of Wisconsin) which kills rats by a different principle, namely, by affecting the blood so that it will not clot and causing the rats and mice to bleed to death internally. The rats and mice are unable to detect this poison and will eat it up to the day they die. Teachers of vocational agriculture and home economics can get this manual by writing to the above address.

The Agricultural Chemicals Department of the PENNSYLVANIA SALT MANUFACTURING COMPANY has two valuable bulletins on control of livestock insects. No. 204 is called "How to Control Flies and other Livestock Pests with Lindane." No. 205, "How to Control Insect Pests on Livestock" is similar to 204 but gives alternate treatments and suggested combinations of them for a long list of pests common to livestock. If you would like to have one or both of these bulletins, send a postcard to Pennsylvania Chemicals, Agricultural Chemicals Department, 1000 Widener Building, Philadelphia 7, Pa.

Drafts that come through a screen door can be shut out by using transparent shatter-proof material manufactured by WARP BROTHERS of 1100 N. Cicero Avenue, Chicago 51, Ill. The material can be used not only on houses but on cow barns, chicken houses and hog pens.

## Heads Save Heels

(Continued from Page 6)

bering and appliances. The Holstein cattle are artificially bred, and a gutter cleaner and other labor-savers are in evidence. The Earl's poultry enterprise includes a laying flock, a breeding flock, broiler flocks, a hatchery, a processing building, including a feather picker and freezing locker, and a sales department for feed and poultry equipment.

Young Jim Earl needed more feed for those high producing Holsteins. Additional land was unavailable, so he reclaimed a long-time neglected field on the mountain. It had had no plow in it for a generation—maybe two. It was overgrown with thornapples and briars. These were tugged out, along with numerous large rocks, and the ground fitted after generous applications of superphosphated manure.

Unable to get the recommended varieties of birdsfoot trefoil, Jim was forced to sow European very late. Usually, trefoil is very scant the first year and sparse the second. This field is thick, rank and high and demands clipping.

### Pen Stables

Neighboring Earls' is the new pen stabling barn and milkhouse of David R. Chambers. Pen stabling is no novelty now in these parts. Unique is Chambers' apparatus for taking the milk directly from cow to cooler through stainless steel pipes. A more sanitary method is difficult to find — or to imagine.

While under construction on the main road to Bainbridge from Sidney, the large octagon structure was thought by passersby to be an enormous skating rink. The 11,000 feet of floor space provides space for 2,000 chickens belonging to Llewellyn Hubbard.

Among the first users of the superior Ranger alfalfa in the area is Ed George of East Guilford. Birdsfoot trefoil is being grown currently by a large num-

ber of farmers. Among these is Gustav Wolf of Sidney Center, who has seeded it in two places on his hill farm. Alton Clark of Sidney Center has grown it for a number of years now, as has Dr. R. M. Monroe on his Unasego Farm. The dean of them all seems to be Cecil Hallock of the Sidney Center-Chapel Hill road. About ten years ago Mr. Hallock sowed half an acre with oats as a nurse crop, and another half acre without a nurse crop. This acre patch was one of the experimental field tests Cornell wanted before publicly advocating the legume. Although less luxuriant than formerly, this patch is still producing.

### Ladino Pastures

Another of the newer legumes becoming increasingly popular is ladino clover. Among others, Clifford Mott of Masonville is finding it an excellent pasture plant. He and his sons disc down five to ten acres annually and, after suitable fertilization, sow ladino where previously were hummocks and hollows with low grass and high brakes.

More and more the value of high producing cattle is being realized. Hybrid corn has practically eliminated the pure varieties of corn in this section. Hybrid chickens with their added vigor are keeping in business poultrymen who otherwise would be defeated with diseases. Nitro-sol, a chemical, is planned to go into the ration of birds from the chick stage next year by many local raisers. The efficacy of this preparation lies in its ability to make the skin of a bird yellow and inviting to a housewife. Sex hormones may be injected for this purpose, also.

These illustrations are but a sampling of the many that could be cited. All in all, Sidney and vicinity have a wealth of superior dairy cattle and modern agricultural practices and devices. To these, as to the famous Scintilla plant, we may well indeed point with civic pride.

## IT HAS WEATHERED STORMS

IT isn't often that trade and professional journals last through generations and grow better with the years or even live up to the promise of their first few months of publication. The sweat and toil and thought that go into their make-up and the money necessary for their beating the deadlines is not always available. Through wars, five of them: the Mexican War, the Civil War, the Spanish-American, World War I and World War II; through good administrations and bad; through gold rushes and panics, the AMERICAN AGRICULTURIST has weathered them all.

This thought is driven home by the following item printed in Vol. II, No. 1, of the Pittsfield, N. H., *Gazette*, January, 1867. This excerpt from the literary column of that issue over eighty years ago is in a way a milestone along the road of farm publications.

"The publishers of this paper have

made arrangements to furnish the *Post* and the AMERICAN AGRICULTURIST together for \$2.50 a year. This is a good arrangement, as the *Post* is carefully made up for family reading, and each number contains, besides the news and political discussions, full and interesting accounts of new books, Home and Foreign Gossip, the current talk of our own and foreign capitals and a great variety of interesting matter. The AGRICULTURIST is a monthly journal of the highest character in its branch. It is generally regarded as the best paper of its class in the country, and its value in the future will be greatly enhanced by a liberal expenditure on the part of its publishers."

The AMERICAN AGRICULTURIST was then in its twenty-fifth year. The *Gazette* was edited and published by D. T. Neal at City Square in Pittsfield. Neal was also agent for Mason and Hamlin Cabinet Organs. The *Gazette*, along with Mr. Neal and the organs, has passed by in the parade; the AGRICULTURIST marches on.—E. Harold Young.

### Fun For Halloween!

**B**UBBLE, bubble, toil and trouble —and the most fun of the year if you give a gay Halloween party for your crowd! To help you plan it, we have prepared three pages of suggestions for decorations, refreshments, games and stunts. Write to American Agriculturist, Box 367-H, Ithaca, N. Y., and ask for "Fun for Halloween." Please enclose 3 cent stamp for mailing, and write your name and address plainly.

## SUNNYGABLES NOTES

By John B. Babcock

**H**ERE in the Northeast, we are pretty well sold on a program of animal agriculture which finds its foundation in grassland farming. This better-balanced and more stable system of livestock farming is gaining a foothold in the South, too, where better farms are being built on the fields which, our history books tell us, have been depleted almost to uselessness by tobacco, cotton and other cash crops. Other parts of the country are also recognizing that an increased animal population is to the long term benefit of the consumer, the farmer and the land.

It is interesting to speculate on how rapidly animal agriculture will continue to grow, and what practices will be developed to encourage the growth. Over the years ahead, it is certain that the government will have an important voice in determining how fast we improve our national livestock picture. Government action will do much to tell the farmer whether he can afford to be a grassland-livestock farmer.

Many experts feel that in a perfectly free economy, farmers will naturally tend toward increased livestock. In a nation with a strong market for meat, poultry, eggs, cheese and butter, the farmer will seek to supply this market, since profitable operation consists of supplying those products most wanted. A better understanding of the benefits of a high protein diet will prompt him to support a national farm and food policy that favors livestock production.

We are not eating a bit better than we did during the war, for food production has barely kept pace with population increase. What gains might have been made were cancelled when the government paid more than the farm animal did for price-supported grain, and when ceilings on beef further discouraged raising our cattle population.

These are mistakes we learn by. They demonstrate that our progress in animal agriculture and the job we do of supplying what consumers want most is heavily dependent on government action.

### MASTITIS AND MILK

**L**IKE the common cold in humans, perhaps less is known and more opinions are advanced for the control of mastitis in cows than any other sickness that can occur. In recent years, both Jack Conner at Sunnygables, and Boots Poelvoorde on his farm, have made remarkable records in preventing loss of cows or milk from mastitis. We like to think that our pen stabling has something to do with good control, but are aware that a good many other factors are involved.

### Long Cow Life Essential

Casting his lot as he has with Brown Swiss cows, Jack is vitally interested

in getting a good many years of mature production from an individual which does not develop into full production as fast as other breeds. Protection of her udder is essential to this long life, and mastitis stands as the biggest threat to the life of an udder.

### Control Program

The other day I mentioned to Jack that we are extremely fortunate to be so close to the New York State Veterinary College at Cornell University. We have the benefit of recent findings, new medications and extremely good service. Jack has been under a mastitis survey program since 1947 that has been extremely helpful in maintaining a clean herd. In fact, during that period, Jack has had only one cow show up with the dangerous "strep" form of mastitis. She was a cow brought from the outside into his herd, and before she came down with a bad quarter, treatment put her back in the "negative" class, where she is being watched and checked. On a visit to the "vet" college the other day, I asked Dr. S. J. Roberts if Jack's record could be duplicated on a farm a long way from the services of the college.

### Broad Control Program

"Jack is under our survey," Doc explained, "not just because he is handy to the College here, but due to the cooperation he offered when we selected herds for our state-wide survey. Other herds are under the Veterinary College program all over New York, and a great many more are carrying on mastitis control programs on their own with local veterinarians who are doing about what we are."

Doc explained to me that mastitis control is more than a frantic search for a magic drug that will cure the cow when she comes down with a bad case. There are already treatments that can knock out most forms of mastitis in short order. Going at the problem that way, though, can never get to the cause. Strange as it seems, better medicines for clearing up mastitis can actually move us toward a time when there is more, rather than less, mastitis. Because they are confident that the disease can be knocked out quickly, farmers relax the management that prevents the disease in the first place.

For that reason, Cornell started a careful study in 1946 to get at the whole mastitis problem. Dr. M. G. Fincher heads up the survey with the staff at Ithaca and six field laboratories throughout the state. A great many herds, like Jack's, are being studied, and more and more dairymen are contributing to the findings by cooperating on a control program with their local veterinarians. Doc Roberts told me they are finding out some things that will eventually lead to greatly improved control.

### Management Most Important

"Jack isn't ahead of the mastitis game because he just happens to be in the Ithaca area," Doc Roberts explained. "It is just that he is doing the right kind of job with his herd. When the survey started, for instance, we found that almost 38% of the herds had streptococcal infection. We want to reduce this figure by treating or eliminating the infected cows as Jack did. And the only way we can do it is

through good management on the part of the cooperating dairyman."

Doc went on to explain that a dairyman doesn't need the services of a laboratory or highly technical tests to clean up a herd. Physical examination by a good veterinarian, and heeding his advice regarding chronic cases, can eliminate almost all mastitis from the herd. Vets aren't ruthless about condemning infected cows. Many animals respond to treatment and never turn up positive again. But when a cow continues to show signs of mastitis no matter how carefully she is handled, she must first be segregated from the herd, and if the condition persists, be sent off to the butcher in order that the health of the entire herd is not threatened.

"There's no doubt that chances for mastitis increase with age," Doc also explained, "but in a clean herd, there is no reason why a cow can't expect a longer productive life if injury and scar tissue from previous infections don't weaken her chances of keeping a healthy udder. That's why we strive to have and keep a clean herd like Jack's."

### Watch Outside Cows

In a herd that is relatively free from mastitis, it is wise to raise your own replacement stock. This doesn't mean that cows cannot be brought into the herd from the outside without endangering the herd, but when this is done, the new cow should be checked frequently, and watched closely to be sure she meets the herd standards. After all, there's no use shopping around for trouble.

### FORAGE REPORT

**W**ATCHING our pastures and hayfields develop holds the same interest as following the development of a calf or heifer. They don't always turn out as expected.

Jack depends on a field of orchard grass for his earliest silage crop. Now in its second year, this piece has never had in it the legumes originally seeded. When the seeding was completed in the oats, it turned out that we had misjudged and put on 8-10 pounds of orchard grass seed per acre. The legumes just never had a chance. Now that we have a fine seeding of orchard grass, though, we will see just how far we can push its production, and with fertilizer, just how early we can move in to cut it.

Our six-year-old alfalfa piece appeared to be running out last year, but recovered nicely with the heavy 0-20-20

fertilizer application this season. More important than the recovery of the alfalfa, though, is the reappearance of ladino which had apparently run out last year. I've heard of clover appearing from nowhere when adequate plant food was provided, and on the strength of this, Jack and I still stick to our plan of a light top dressing with stable scrapings this winter, and another good dose of phosphate and potash next Spring and Summer. The big gamble is to regain production without plowing and fitting for a new seeding. From the rocks in this particular piece, I'm not sure Jack could buy enough plow points to do the job anyway.

### GRAIN DISAPPOINTING

**D**ESPITE the fact that he was all set to handle a lot of acreage on a custom basis, Boots found the weather against him during grain harvest this year. Too much late season moisture brought the yield to about half of what was hoped for on wheat, and resulted in almost a total loss for oats that were left to combine. Both Boots and Jack had oats that were not worth cutting. We didn't have too much rain—it just came at frequent enough intervals to keep the grain too tough for threshing.

We have abandoned corn-raising at Sunnygables because of disappointments several seasons running. During and since the war, we have had good luck with small grain, almost to the point where we have depended too heavily on it for a cash crop and for home grown feed. I was reminded this season of a decision we made about ten years ago to stop raising more small grains than were needed to start pasture seedings.

High grain prices started us back in the cash grain business during the war, and we believed wheat and oats could stand even more emphasis because they made money consistently. Now, after a bad season, we are backing away again. We'll grow quite a little grain again next year, but will try not to count too heavily on it 'til it is in the barn.

The way we change our minds about small grains is much like the lady who waved frantically from her car window and then cut across the wrong lane to make a left turn. When the police officer asked her what kind of a signal she had given, she replied that her particular wave at that point was to let everyone know she had changed her mind. We are changing our minds, too, but don't know yet quite what we shall do.

A necessary part of all sensible milking procedure is stripping to check for quarters infected with mastitis. A strip cup readily shows stringy or flaky milk, as does the strip plate pictured here. In some ways the dark, smooth plate has advantages, for it can be set in any pail with assurance that no milk is sprayed on the floor under the cow. Milk on the floor under the cow is not as important where the parlor is washed down daily. At the first sign of lumpy milk, call the vet!

Incidentally, there is an excellent bulletin available at the N. Y. S. Veterinary College by Drs. H. G. Hodges and S. D. Johnson, called "Mastitis Control." You can get one by writing the N. Y. S. Veterinary College, Cornell University, Ithaca, N. Y.

## A. A. Cattle Rustling Award

(Continued from Page 3)

arrest can best be told in Ward Tiffany's own words in the letter he wrote us following Armer's arrest on June 24:

"I just read the cattle rustling article in AMERICAN AGRICULTURIST. I happen to be the man who gave a very good clue which led to the arrest of Matthew Armer.

"On May 17 I went to Oneonta to buy a cow at the Empire Livestock Market. Seeing none that suited me at the sale I went out to the loading chutes and saw a Jersey cow in a three-quarter ton truck that looked like a good cow. The man quoted me a price of \$150 and I bought her and paid him the money.

"I rode with him when he brought the cow to my place. I asked his name and he said it was Armer and that he was from Cobleskill and needed money to fix his teeth. I thought he was on the square so thought nothing more about it.

"Then after Corporal Arthur Diffendale was murdered I saw a picture of the truck which I recognized as the one belonging to the man who sold me the cow on May 17. I told the police the story on June 21, and looking through the Empire Livestock Cooperative's records of the cattle sales at the Oneonta auction they found the name of "Armer" from Nassau, N. Y. who had sold quite a number of cattle there.

"That same afternoon they came to my place and identified the cow as one that had been stolen in Massachusetts on May 8. They said her real value was around \$500.

"On June 24 I went to the Sidney Barracks and picked Armer out of a line of eight men as the one who had sold me the cow. They also had the truck there which I identified."

Immediately on receipt of the above letter we wrote Mr. Tiffany that we would consider it as a claim for the reward and that we would write him again at the conclusion of the trial. The \$100 check already mentioned was the result. The fact that Armer was tried for murder rather than cattle stealing did not enter into our decision. However, it was possible that some other person should share in the reward, therefore, we wrote to Captain H. A. Gay of Troop C, New York State Troopers at Sidney who replied as follows:

"In reference to your letter of September 19th, please be advised that we are glad to state that the Armer case has come to a successful conclusion and also to state that it cleared up more than 50 cases of cattle stealing in New York, Pennsylvania, Vermont and New Hampshire.

"Ward Tiffany, Route 2, Unadilla, N. Y. did buy a cow from Armer, which was stolen from Mr. Palmer of Trymingham, Massachusetts. This cow is still in our possession but has been ordered to be returned to Mr. Palmer just

as soon as he may be able to call for it.

"Mr. Tiffany and his wife gave us the first lead which enabled us to bring to justice one Matthew Armer for the killing of Corporal Arthur Diffendale and he did ride on the truck from Oneonta to his home at Route 2, Unadilla, New York."

Very truly yours,  
(signed) H. A. Gay—Captain  
Troop Commander

No money that AMERICAN AGRICULTURIST has ever spent has given more personal satisfaction to members of the staff. We like to feel that the \$100 reward we offered (which incidentally will continue until Jan. 1, 1952) had some part in cleaning up this case. But cattle rustling is still going on. If you have cattle stolen, notify your State Troopers and other police authorities immediately; give them every bit of evidence available, and if your evidence results in a conviction and prison term of at least 30 days we will be very happy to send you a check like the one that went to Mr. Tiffany.

## Service Bureau

By D. M. SPAULDING

### POSTING

I have been told that land must be posted before the end of September in New York State. Is that correct?

No. Land can be posted at any time during the year in New York State. However, to keep your land legally posted, illegible or destroyed notices must be replaced at least once a year during the months of March, July, August or September.

For the convenience of readers, AMERICAN AGRICULTURIST has available No Trespassing signs which meet the requirements of all northeastern states, with the exception of Vermont. These are printed on a heavy, coated canvas stock; and you can get information about them by writing American Agriculturist, 10 N. Cherry St., Poughkeepsie, N. Y.

### YOU'RE WELCOME

Thanks a million for getting my money back. I consider the \$3 I spent for a subscription to your paper one of my very best investments. I am a working man and cannot afford to lose \$12, and I appreciate your getting the refund for me.—W.H.G., New York.

### UNETHICAL

I have seen an advertisement of a clinic in New Jersey. They treat people suffering with hernia, and I am interested. What do you know about them?

We checked with the American Medical Association about this clinic. They tell us that they cannot recommend such places. Advertising by a physician is considered unethical. We suggest that anyone who has something wrong with his health should consult his physician and follow his recommendations as to treatment.

# Identical Twin Heifers used in Amazing Feed Test\* at DAWNWOOD FARMS

**CANDY on Milk**  
gained 103 lbs.  
in 3 months  
COST **\$57<sup>33</sup>**

**SANDY on CAF-STAR**  
gained 112 lbs.  
in 3 months  
COST **\$14<sup>95</sup>**

*\*The test was conducted under normal dairy farm conditions.  
Weights taken monthly by E. Van Steenburgh, DHIA Supervisor.*

We take pride in the calves that we raise on our farms. We want them to look thrifty with bright eyes, fine coats, deep bodies.

That's why we made CAF-STAR. And then by good luck, the identical twin heifers, Candy and Sandy, were born. We were able to make the famous feed test which *proved* that CAF-STAR helps develop bigger animals with better bone growth—and at a big saving over milk. We feel that all dairymen should know about our "formula feed for calves" CAF-STAR.

Cordially,

*Dawnwood Farms*

CAF-STAR is available in 25-lb. blue pails\* and in 25-lb. or 100-lb. (economy size) bags. Just mix this highly nutritious concentrate with water and feed quart for quart instead of milk. It may also be fed dry.

Ask your feed dealer for CAF-STAR. The 25-lb. package contains a month's supply for one calf at a cost of about 18 cents per day.

*\*The 25-lb. blue pail is now in short supply due to national defense restrictions on metal. You get the 25-lb. CAF-STAR bag at a saving.*

**DAWNWOOD FARMS, AA-6, AMENIA, N. Y.**

Dear Sir: Send me absolutely FREE:

1. Special chart for keeping my records of Calf Weight Increases with Accepted Breed averages for comparison.
2. Special measuring tape that tells you the calf's weight by measuring the number of inches around the heart girth.

## "Beauties" Raised at Dawnwood Farms fed CAF-STAR and DOTS

Typical of the fine animals raised at Dawnwood Farms, these beautiful yearlings were started on CAF-STAR followed up by DOTS.

Identical Holstein twin heifers, 2 months old, now being fed on CAF-STAR. They are also being fed 2 measuring cups of DOTS (our new pelleted formula) sprinkled on top of their grain ration. We give them all the grain they will clean up.

Candy and Sandy were bred at 13 months. Both calved under 2 years with fine heifer calves. They were bred again for second calves when they were only 2 years and 2 months old. They are milking and will make over 400 lbs. of fat this year.

### FINE NEW PELLET FEED

After thorough testing and long use at Dawnwood Farms, we can now offer you DOTS to help your calves grow into bigger, sturdier animals with capacity for big production.

This formula feed in pellet form was developed as a follow-up dry feed for calves when being weaned from the liquid CAF-STAR feeding. DOTS help prevent the setback that may occur at weaning.

And DOTS stimulate rumination at an early age. The calf begins to chew its cud; the digestive organs develop sooner. Ask your dealer for DOTS.

THE FARM PAPER OF THE NORTHEAST

## Four-Legged Friends

By William Gilman

IT'S an age of growing specialization, and an increasing number of farmers in New England now concentrate on a single "crop," like the orchardist who raises only fruit or the poultryman who says he "wouldn't have a cow on the place." But it's hard for such farmers to give up four-legged creatures entirely. Here are a few examples of Vermont poultrymen who have found themselves excuses for having a few animals around.

RIGHT, On their poultry farm near Manchester Depot, Vt., Earle Fowler and son Robert, right, keep two dozen sheep. In addition to wool and lambs, the Suffolks help out on the poultry end by keeping grass mowed on the pullet range. The sheep are rotated through the pasture, keeping grass short and succulent for the 2,500 birds raised each spring for replacements. Hip-high sheep fencing separates the plots, keeping the animals where they belong, but allowing birds to range where they please.

Karl Stevens, poultryman of Weathersfield Bow, Vt., breeds collies as a sideline and claims that Flicker has turned out to be a very good "bird dog." She helps by running stray pullets back home on the range. Flicker is illustrating how she hopefully hunts fleas on a hen. Stevens discovered this habit one day when he found Flicker had included a hen among her pups—and was working hard looking for fleas in feathers as well as fur.

After several years building up a laying flock, Louis LaFlam abandoned market gardening eight years ago and went in exclusively for poultry farming on his place near North Ferrisburg, Vt. But he saved space in his new henhouse for a stable to accommodate the family cow and faithful Jerry, his horse now 20 years old. "When I used to need him in gardening work," LaFlam explains, "Jerry always did what I wanted him to—so he can count on a home here for the rest of his life."

LEFT, Grading and packing eggs near the furnace would be hard on the eggs. So Dwight G. Bigelow, poultryman of Essex Junction, Vt., uses that spare space in the basement of his new 5,000-bird henhouse to keep his Boxer pups snug in winter. Raising the pure-bred dogs is strictly a hobby with Bigelow—he says he's satisfied if they repay expenses. He's pretty fond of the hens that bring in the egg checks, but points out that for a real pet you can't beat a canine.

A good calf,  
a friendly hand  
a fine feed...

# G.L.F. Calf Starter

Each year thousands of northeastern dairymen are finding that the combination of a good calf, a little extra patience and care, and the right feeding plan will produce the type of replacement they want in their herds.

Milk and G.L.F. Calf Starter go together for the feeding plan that gets the best results in raising a calf.

About the time a calf learns to drink from a pail she is ready

for her first handful of G.L.F. Calf Starter. From then on all you need to do is put a day's supply of Calf Starter in the feed box each morning. When the calf is three weeks old, supplement the Calf Starter with a generous supply of your best early-cut legume or mixed hay . . . along with plenty of clean, fresh water and salt.

Cooperative G.L.F. Exchange, Inc., Ithaca, N. Y.

*Build bigger calves the "G.L.F. Calf Starter" way*

## What Can I Do?

By E. R. EASTMAN

**L**AST time in this column I stated that I often hear my friends say something like, "Well, I am only one of 150 million people in America, what can I do?"

This column is an attempt to answer that question. We start with the idea that in a great Republic the citizen is more important than the government, and that government exists for the individual, never the individual for government.

In order to keep that basic principle, however, the citizen must live up to his responsibilities, and one of the chief responsibilities in a Republic is to exercise your right to vote. If you don't, the time may come when you won't have the right. An election is coming up on Tuesday, November 6, and although it is not a presidential year, this election is particularly important:

First, if you don't vote in this election, you cannot take part in your party's primaries next year, which is a presidential year. In my opinion, the primaries, where the candidates of your party are chosen, are more important than the election itself.

Second, there are many important local officers to be elected this fall. What your supervisor or your selectman or your county commissioner does, for example, may be far more important than what some officer in the State or the President of the United States does.

Third, in New York State there are

six suggested amendments to the Constitution on which you will be asked to vote on election day. For an explanation of these amendments, see Page 8 in the New York edition.

Now, in addition to voting yourself, what else can you do in connection with the coming election? The organization known as "Freedom on the March" has made some most excellent suggestions which I herewith pass on to you:

1. Organize an election committee immediately for your district or community. Get the committee to meet and plan a campaign to get out the vote. Explain any local issues involved.

2. See that every eligible member of your family votes.

3. Get every member of your committee to contact at least five other persons to urge them to vote and to have their families vote. Ask those five persons to telephone their friends and urge them to vote. In other words, start a "chain reaction" by telephone to get out the vote.

4. On election day, you and your committee provide cars and drivers to get everyone to the polls.

5. After election day, hold a meeting of your committee and check the results to determine how to do a better job next year.

6. Send a summary of the results achieved by your committee to Freedom on the March, 119 South Cayuga Street, Ithaca, New York.

## Taxes Doubled

**T**HE Honorable Harold Keller, New York State Commissioner of Commerce, in a recent speech charged that "government is expanding into the affairs of business to a point which under American standards could be alarming." He said that the only way to stop this expansion is "for business to take part more and more in government."

"Too often," Commissioner Keller said, "it has been the sad story of an idea or a so-called reform being offered and organized business assuming a position of adamant opposition without an alternative suggestion. As a result, one scheme after another would be put over and the control artists had

us well on the road to socialism."

The Commissioner described the government as "big business in this country." He said that one out of every nine employed persons in the Empire state is on a federal, state or local government payroll. "Ten years ago," he said, "the Federal government took 12½ cents out of every dollar. Last year they took more than 25 cents out of every dollar."

Commissioner Keller has put into words what we of AMERICAN AGRICULTURIST have been emphasizing for years. Unless American business gets out of its own hidebound affairs to work with agriculture to save free enterprise, the time is not long distant when there will be no free enterprise in America, and less liberty than there was before the Declaration of Independence.

— A. A. —

### RESTORING CONFIDENCE

**B**OILING mad at the extravagance, waste and scandal in government, and in particular at the mismanagement and scandal in the State Department, the great American Legion in annual convention on October 18 demanded that the entire State Department leadership be fired. Said the Legion:

"To obtain the leadership required, we demand the immediate removal of the present corps of leaders whose every action has reflected incompetency, indecision and defeatism. They must be replaced and the State Department reconstituted with men of unquestioned loyalty and of high purpose, to the end that the confidence of all Americans in the conduct of our foreign affairs may be fully restored."

"I think it's grand the way your wife lets you smoke in the living room."

## Loads Higher, Spreads Wider, Lasts Longer

That's why a **NEW IDEA** is a good idea!

**Famous NEW IDEA Wide-Spread Distributor**—working smoothly as a unit with 100 U-shaped beater teeth—quickly breaks up manure, even the tough chunky kind. Wide, forward-set upper beater frees top of load first to prevent choking. Specially designed distributor blades assure thorough shredding, finer pulverization and wide, uniform spreading.

**Mr. D. M. Weber, Renfrew, Pa.** with his NEW IDEA Spreader—used steadily for more than 38 years. Says Mr. Weber: "My expense on this spreader has been less than 10 dollars. It has been spreading about 275 loads yearly for me over the past 30 years."

Service records show it...thousands of owners know it...the strongest, *longest wearing* spreader box is built by NEW IDEA. Formed of fully cured pine boards, it defies rot and corrosion year after year. Steel framed and double-riveted, it stands up under heaviest impact and steadiest pounding.

And it's the most efficient box, too! Low-slung for fast, easy loading. Flared at the top to haul *higher* loads without spilling. Tightly packed manure feeds back *freely* on its solid, tapered bed. Pulls lighter on big, easy-rolling wheels.

You're also way ahead every other way with a New IDEA Spreader. Positive shredding and wide, even spreading are *permanent* features. Self-aligning bearings keep it smooth-running *for keeps*. Discharge rate readily controlled to suit any soil requirements. Easy to hitch to any tractor. Easy to handle under any operating conditions. Easy to own, too—ask your local New IDEA dealer!

## MILK DRIVER STRIKE HITS PRODUCERS

ON Wednesday, October 24, 15,000 milk truck drivers and milk plant workers in New York City went on strike, completely disrupting the milk business from Dairyman to Consumer and causing heavy loss to everyone concerned. Fortunately, the strike only lasted one day, because the dealers granted the strikers a \$10.00 a week pay increase.

The strike was called by the Teamsters Union of the American Federation of Labor. Wherever possible, milk on the way to New York City was stopped and turned back to the country plants and, if facilities were available there, was manufactured into cheese, butter and other by-products. Fortunately indeed were members of the Dairymen's League and other cooperatives which had manufacturing facilities. These cooperatives were able again to make good on their promise of a market for their members' milk for every day through the year, even in the face of emergencies.

There will, however, be a loss to Dairymen even when they can deliver to manufacturing plants, because the milk ordinarily sold in fluid form necessarily had to be classified and sold at the Class III price.

This unfortunate situation was caused in part and is complicated by government bureaucracy operating through the OPS (Office of Price Stabilization). On one side, dealers were faced by the striking workmen demanding ever-increasing wages; on the other by the probability that OPS would not approve a price increase to consumers. A large part of the spread between what the dealer pays to the farmer and receives from the consumer is caused by high union wages. Unless the dealer can raise the price to consumers by 1½ to 2 cents a quart he must either suffer a loss or try to pass it back to Dairymen in lower prices. Delivered milk in New York City now sells at 24 cents a quart and 21½ cents at the store. If the OPS approves a raise in the retail price it will undoubtedly cut milk consumption.

At the same time while the milk strike was going on thousands of dock workers were out on a wildcat strike, out of control of their union leaders. Embargoes were placed on freight shipments coming into the port for shipment abroad, and on the docks are piled up millions of dollars worth of supplies, including military supplies for our boys in Europe and Korea, some of which cannot be loaded on the ships because of the labor strike.

Meanwhile, the government does little or nothing to control the situation, or actually helps to cause or complicate it by labor union sympathy and support for political purposes, or by bureaucratic price control.

When will the great body of American people who suffer from these situations—which are not far from anarchy—get mad enough to arouse themselves to restore the kind of government and leadership that will give us back the kind of America that our forefathers handed to us?

## RESERVE FOR DEPRECIATION

THOSE who invested in government savings bonds ten years ago have been unfortunate in having the bonds mature at a time when the dollar is worth only a little over half what it was worth when the investment was made. That, however, no one could foresee, and it was absolutely necessary for American citizens to make this investment in order to win the war.

The answer to this problem is not to cash these matured bonds, but to leave them right where they are, where they will continue to draw interest at

*By E. R. Eastman*

2½%. Later it may be possible to cash them at a time when the dollar value will be higher than it is now.

By the same token, it is good business to invest in defense bonds now, because you will be using cheap dollars to buy them, and when they come due the purchasing value of the dollar may be much higher. Farmers also might well give consideration to buying defense bonds now as a reserve or protection against the rapid depreciation of farm equipment. Your investment in equipment, of course, is tremendous as compared to what it was even a few years ago. The depreciation on this equipment is rapid. It will have to be replaced. A reserve of defense bonds for new equipment, for educating your children, for sickness, is a wise investment and good business.

## DID IT PAY?

SOME FRIEND recently sent me a little pamphlet, only 2½ x 3 inches in size, entitled "The American Agriculturist Centennial Book." This pamphlet was gotten out by AMERICAN AGRICULTURIST in 1876, just 75 years ago, when our Republic was just 100 years old.

In looking through this little pamphlet I found the following editorial, which applies just as much today as it did three-quarters of a century ago:

### A Striking Example

Thirty-four years ago, two brothers settled on adjoining farms, with equal advantage as to soil, markets, capital, etc. One of them subscribed for the AMERICAN AGRICULTURIST, and now and then bought a book or two about his own business—the whole costing an average of \$6 a year. His boys read and thought about their work, became interested in and respected it, and were happy in their toil, because they had something to think about. They grew up intelligent, and settled as good prosperous farmers, respected and influential. . . . The other brother "couldn't afford papers and books," (he could afford 6 cents a day, or \$20 a year, for tobacco, beer, etc.). His boys worked sullenly by day, and "skylarked" at night; they despised and hated their work, which for them was only exercising brute force, with little mind applied. When old enough to escape parental restraint, they quit the farm, one for this, and another for that, and none of them have ever amounted to anything. He is himself a sullen, dispirited man. Six dollars a year would have made a wonderful difference—would have changed their whole course of life. Would it have paid?

## THAT CHIP ON YOUR SHOULDER

IT SEEMS as if half the people I know are ready to quarrel or fight at the drop of the hat. There are more of these folks with a chip on their shoulders now than ever before because of the worrying, insecure times. Unfortunately, this applies particularly to husbands and wives, many of whom injure their health and interfere with their own and their children's happiness by bickering and quarreling. After a while it gets to be a habit, so that it is hardly possible for either partner to say anything at all without the other misunderstanding and picking it up, thus beginning an argument.

There can be only one of two results from this kind of situation, either a grand smash-up ending in separation or divorce, or a life-time of unhappiness. No matter who wins the argument, both parties lose the war. It just isn't worthwhile.

My suggested remedy for this constant quarreling

takes courage, forbearance, and a lot of willpower, but it is the only remedy. Here it is:

1. Stop making biting, sarcastic remarks.
2. When your partner says unkind things, take them on the chin, but keep your mouth shut.
3. Demonstrate a little appreciation and affection. How long has it been since you told your wife that the dinner that she worked so hard to get tasted mighty good, or said, "that was an exceptionally fine pie," or "you're looking very pretty today"? How long has it been since you put your arms around her and kissed her and told her that you love her?

And you, lady! You thought your husband was pretty slick when you married him. What are you doing to show him that the years have intensified and deepened your love, that you appreciate the hard work he is doing? When, in passing, have you let your hand rest lightly on his head or shoulder, thus demonstrating that he is still the man in your life?

Marriage is a cooperative enterprise and, when it works, it is the most satisfying cooperative organization in the world. But cooperation is a two-way road, and happiness is like all other precious things in this world: it has to be worked for long and constantly. We get out of marriage, as out of every worthwhile thing, just as much as we put into it. We get only by giving.

## TAKE TIME TO CHECK

THE OTHER evening there was excitement at our house when the chimney burned out. We were to blame because we had not cleaned the chimney in years. Fortunately, the fire did not get up into the main long chimney and was not too serious.

I mention this because it seems to me that next to the injury or death of someone in the family, a farm fire is just about the most tragic thing that can happen, and most of them can be prevented. This is the time of year when a heavy load is put on all electrical gadgets and when we start the long heating season. Therefore, it is just plain common sense to check over all fire hazards now. See that there are no loose electrical connections that are liable to short-circuit, that the chimneys are clean and in good repair, that any messes are cleaned up in buildings where fire could originate, and be especially careful that no smoking of any kind is allowed in the barns.

## A GOOD REMEDY

MANY of us remember the Saturday night bath in the kitchen in the old washtub, with hot water from the reservoir on the kitchen range. The coming of the modern bathroom changed all that, but still the Medical Society of the State of Pennsylvania thinks that some of us are not too clean.

The normal human skin, say these doctors, has on its surface an enormous number of bacteria, which are ordinarily harmless. A break or cut in the skin, however, permits harmful bacteria to enter and carry disease. Uncleanliness in habits of living is said to be responsible for more sickness than any other cause. Epidemics rage where personal hygiene is at a low point.

There is a simple treatment for uncleanliness. It is a four-letter word—soap!

## EASTMAN'S CHESTNUT

A MOTORIST came into a restaurant out of a terrific rainstorm.

"Gee!" he said to the waitress as she came to take his order, "that certainly looks like the Flood."

"The what?"

"The big Flood. Haven't you read about the Flood and the Ark landing on Mount Ararat?"

"Gee, Mister!" she replied. "I haven't had time to look at a paper all week!"

# AA's Farmers' Dollar Guide

**INCOME TAXES:** Higher taxes start November 1 and the average increase will be about 11 per cent. Profits from sale of animals used for breeding, dairy or draft purposes, if you have owned them at least 12 months, will be subject to the capital gains tax instead of treated as ordinary income. If you sell a dwelling house the money is exempt from tax if you reinvest it in another home within a year. If you belong to a cooperative you must include patronage refunds, whether in cash or promises of cash, as income, and Co-ops must report patronage refunds of \$100 or more to any one person.

As taxes get higher, it is more and more important that your income tax report be made carefully. If you neglect to deduct business expenses, you are the loser. You need better records for figuring and if you are running a good size business it will probably pay to hire some one to check your return.

Most Northeastern colleges of agriculture publish a yearly bulletin each fall, giving much information that will help in making a farm return.

**CROPS:** The U. S. APPLE estimate dropped 2 per cent during September. The expected crop is 5 per cent below last year but nearly 8 per cent above the 10-year average. The reduction was largely the result of wind storms in New York and Michigan and dry weather in Pennsylvania, Maryland, Virginia, and West Virginia.

The October POTATO estimate was down nearly 10,000,000 bushels below the September 1 figure. It now stands at 337,122,000 bushels. Prices are trending upward and some farmers are holding their crop.

**CONTROLS:** Although not officially admitted, chances that beef cattle will be decontrolled are increasing. "Controllers" who seem to be trying to find a way to back up without admitting failure, are blaming Congress for failing to give them more power, packers and cattlemen for not cooperating, and the USDA for lack of enthusiasm for controls.

**SULPHUR:** USDA has done a good job of pointing out agriculture's needs for chemicals, also for equipment. But the policy is to meet other needs first and let agriculture take what's left. The fact that food production cannot be increased on short notice should not be overlooked by those in authority.

One short material is sulphur. Agriculturally it is important for making fungicides and fertilizer. It is an important ingredient in superphosphate.

Result of shortage will be a change in fertilizer ratios; they will have less phosphorus. Agronomists agree that where fields have received phosphorus liberally for years, the supply has been built up in the soil. In New England much commercial fertilizer in the past has been a 5-10-10. New grades are more likely to have 6 to 8 per cent of nitrogen, 8 per cent of phosphoric acid and 8 per cent of potash.

**EGGS:** It is expected that egg prices are about at their seasonal peak and are likely to show some decline in November and December. If you haven't culled, do it now and then look the flock over periodically to remove hens that aren't laying.

**QUESTION:** When prices decline national income drops; business and employment fall off. Present administration seems committed to the idea that government should prevent big booms and serious depressions by using public works, subsidies, etc. to increase buying power when depression threatens.

But suppose the general price level dropped 10 per cent and as a result, national income dropped in the same proportion, which would be well over \$25 billion. If government tried to pump that amount of buying power into economy, either taxes would have to be increased or money borrowed, and that amount added to the national budget whatever it might be—\$60 or \$70 billion—or maybe by that time \$100 billion. Could they do it? You be the judge. And suppose prices should drop 20 or 30 per cent, what then?—Hugh Cosline

## The Song of the Lazy Farmer

NOVEMBER'S coming tickles me; I'm always happy as can be when winter arrives again, cuz it's the only season when I can relax beside the fire and not arouse Mirandy's ire. It's not like spring when she screams loud if I don't help get fields all plowed; in summer, when small grain gets ripe, my loafin' gives her cause to gripe; in early fall, a million chores all pressure me to get outdoors, and if I try to loaf and slack, she's sure to make some nasty crack.

But soon as sky shows signs of snow and icy winds begin to blow, the heat is off and I am free to do my loafing openly. The choring won't amount to much, just feeding cows and hens and such; an hour of milking twice a day—that job's Mirandy's anyway; some eggs to gather now and then, and I cannot remember when Mirandy ever did allow me in the henhouse anyhow. And so the next four months will be a mighty pleasant time for me; instead of being forced to sneak on where I cannot hear her speak, I now can squat in my own chair and know the boss won't even care.

# don't let winter rust catch you napping

When it's lay-up time for your farm machinery don't *you* be caught napping! RIGHT NOW is the time to give your equipment complete all-winter protection.

Let Esso Rust-Ban products give the proper kind of protection to your valuable machinery NOW for longer life and bigger profits!

**ESSO RUST-BAN 347** is easily, quickly applied with a rag swab or old brush to plows, cultivators, discs and other implements. This protective coating guards against rust and adds years of usefulness to hard-to-get farm machinery.

**ESSO RUST-BAN 603** resists rust formation on inside of idle engines by forming a lasting film. Rust-Ban 603 gives dependable, all-winter, protective coating to cylinders, pistons and other inner precision parts. For best results follow directions when using.

Your **ESSO FARM DISTRIBUTOR** has a complete line of dependable Esso Farm Products—Esso Extra Motor Oil, Essolube HD, Esso Tractor Fuel, Esso Extra Gasoline—to help you get performance-plus from your tractor, truck, and other machinery.

**FOR UP-TO-DATE INFORMATION—** ask your Esso Farm Distributor for a *free* subscription to the regularly published **ESSO FARM NEWS** or write to: Esso Farm News, 15 West 51st Street, New York 19, N.Y.

BY FARMERS • FOR FARMERS

Here is Frank M. Brown of Tunkhannock shown with part of his 30-head purebred Guernsey herd.

# Frank M. Brown-Wyoming County Wins Pa. Green Pastures Contest

By STRATTON STEVENS

**F**RANK M. BROWN, Sr., Tunkhannock, 31-year-old veteran of World War II and winner of the Pennsylvania Green Pastures Contest for 1951, owns and operates a 30-head purebred Guernsey dairy farm of 92 acres of which 20 acres are in rotated pasture plots of four to six acres each. These pasture plots, all established in the last three years, have been seeded to orchard grass, ladino clover, brome grass and alfalfa. He also has three acres of permanent pasture seeded in 1932 to bluegrass and white clover making a total of 23 acres pasture. He has had ample pasture, even with a dry summer, and three acres of the first growth were cut for grass silage for winter feed.

## Rotates Pasture

Frank rotates his pasture fields, moving the cattle to a new strip when the grass has been grazed to a height of two to three inches. Each field is clipped after grazing and the droppings spread with a homemade spreader made of old wheel rims welded together with chains. The pastures are established on land that had not been reseeded or limed and fertilized for 15 years and was partially grown up to weeds and moss. The year before the strips were broken up for reseeding the 20 acres did not provide enough pasture for 10 head. Two of the strips were planted to grain crops and the grasses seeded in wheat. The other two were established by working up the old sod and moss with a field cultivator and disc harrow in the spring. No nurse crop was used. The grasses were seeded in the sod mulch.

### Plant Food Used

Superphosphate was applied with the manure used to top dress the old sod before breaking it up, and as a top dressing on each new seeding the first year. Each field is top dressed each year with 500 to 700 pounds of 0-14-14 fertilizer. Boron was added to the fertilizer on each strip the first year. The permanent pasture of bluegrass and white clover has been top dressed with manure and superphosphate, and one application of complete fertilizer was applied last spring.

Frank was born on a farm in Northmoreland Township, Wyoming County, and following graduation from Tunkhannock High School was a car salesman for a year before entering Williamsport Technical Institute. He worked as a welder, pusher and erection foreman for a construction company before entering the armed services.

After being discharged from the

armed services in February 1946, Frank returned to his father's farm where he started farming, renting 25 acres from his father. He enrolled in Institutional On-the-Farm Training with the original group in Wyoming County May 1, 1946. He rented fields on a neighboring farm during that summer and fall. The next spring he rented the entire farm of 92 acres. During this time he increased his dairy herd from four heifers and two calves to ten milking cows and ten heifers. In April 1948, he bought the farm he had been renting. He put water in the barn and house, drilled a well, built a new milk house, blasted fourteen hundred feet of ditch to drain and reclaim eight acres of land which are now part of the rotated pasture on his farm. That fall he sold all the milking cows and bought registered bred heifers.

## More Power

In 1949, Frank sold his team and bought a tractor and tractor equipment. He was elected the first president of the Wyoming County Young Farmers Association and named as a director of the newly organized Soil Conservation District which he helped form. During the year, he removed stone walls and worked up the land which he had drained.

In 1950, the farm was planned by the soil conservation district, strips were laid out, the permanent pasture improved with lime, superphosphate and manure, and new pasture seeded to ladino clover and orchard grass. All his cows were bred artificially by sires from NEPA Breeding Cooperative at Tunkhannock and all calves were vaccinated for Brucellosis.

## Community Service

By 1951, Frank had completed the change to grassland farming. He built a diversion terrace across the upper part of his pasture fields to control the flow of water over his pasture strips. He employed a full-time hired man who also was enrolled in veterans' on-the-farm training. The rotation pasture program was in full swing. Clippings from the pasture and the first cutting from hay fields were used to fill two silos with grass. Frank was re-elected president of the Wyoming County Young Farmers and named a director of Wyoming Production Credit Association.

Frank has a son twelve years old who is in eighth grade and is very much interested in his father's farming program. As you walk over Frank's farm with him and his son, both help in explaining the program that is working so well.

## Fertilizing ALFALFA in New Jersey

By GEORGE SERVISS

AS A result of recent experimental work on alfalfa fertilization, 0-12-24 is now the number one grade recommended for top dressing alfalfa in New Jersey. The 0-19-19 and 0-20-20 should be used, however, where the soil tests very low in phosphorus. For clover, 0-20-20 is still the number one recommendation. This change in recommendation reflects the fact that where the land involved has been fairly well fertilized over a period of years, alfalfa requires more potash than phosphoric acid.

Another change in New Jersey fertilizer recommendation this year is in fruit fertilization. In general, more nitrogen is recommended than in the past. The grades recommended for most fruits are 5-10-10 and 7-7-7 or 10-10-10. It is recommended that application be made in the spring about a month before bloom, or in late October or November before the soil is frozen.

\* \* \*

### RESIDUAL PHOSPHORUS IN COMMERCIAL FERTILIZER

ONE of the problems of phosphate fertilization is the comparatively low utilization of phosphorus by crops the year of application, whereas nitrogen and potash may often approach 100 per cent.

In other words, if we apply 2000 pounds of a mixed fertilizer containing ten per cent phosphoric acid for corn only about 20 per cent may be used by the first corn crop. The rest fortunately is not lost. It remains in the soil, thus adding to the reserves. However, its availability to most crops is much reduced, at least until a very high phosphorus level has been built up.

Fresh fertilizer phosphorus continues to give a response for many years. However, recent work published by workers in the Agronomy Department at Cornell indicated that on some soils at least the effect of one liberal application of superphosphate showed up in increased corn yields for eight years following the application. In contrast to this, the effect of nitrogen and potash can seldom be measured beyond the year following application. The total returns for all three are high when intelligently used, whether all the benefit is obtained in the first year of application or over several years.

Back some 20 years ago, when we were engaged in fertilizer research the objective of much of the work was to find ways and means of using as little fertilizer as possible and still produce a crop. This was during the depths of the depression when farmers had very few dollars to spend on fertilizer, and labor was cheap. It was sometimes more profitable to stretch their fertilizer dollars over as many acres as possible than to obtain top yields on fewer acres.

Today the picture is much changed. Labor is both high and scarce. Taxes and machines are also expensive. Today much of our fertilizer research is aimed at making the most profit per acre. This concept in many instances means changes in methods of application, rates, and analyses. To get the most out of 100 pounds of fertilizer per acre one would usually drill it with the seed, but to get the most profit per acre out of 2000 pounds very often at least half should be broadcast before plowing and only a small amount placed near the row.

# It's like having Two Tractors

## FOR LITTLE MORE THAN THE PRICE OF ...

# One

**CHANGE FROM ONE TYPE OF TRACTOR  
TO THE OTHER IN HALF AN HOUR**

Now you can have the high clearance and short turning of a row-crop tractor for planting and cultivating—and yet, through the rest of the year, enjoy the stable footing and furrow-following ability of a standard 4-wheel tractor. Get both types of tractor for little more than the price of one. With the fast all-purpose "DC" Tractor and a few extra front-end parts, you can switch over to a standard 4-wheeler in half an hour. This way, you can have a fast cultivating tractor when you need it and a big plowing tractor when that's most practical. Only Case builds a tractor with this change-over advantage—only Case dealers can demonstrate it.

## GET A DEMONSTRATION

Get on the seat of a Case "DC" Tractor at your Case dealer's, next trip to town. Feel its comfort, note how the seat can be pushed back to permit safe standing while driving. Arrange for a demonstration on your farm. Watch its extra lugging pull take you through tough spots. See how the fast hydraulic control speeds your work, saves your strength. Test the steering for quick dodging that gets the weeds and spares the crop—for fast steering on the straightaway, for powerful leverage in sharp turns. Test it for its shock-stopping design that lets even a youngster work rough ground without fighting the wheel. Your Case dealer will explain the quick-change front end. See him about it right away!

### FACTORY-EQUIPPED FOR LPG FUEL

...to get maximum performance and economy from powerful, clean-burning LPG fuel. You can order any Case "D" Series or "LA" Tractor LPG-equipped.

## Potato Prices Make Growers Happy

By L. B. SKEFFINGTON

**M**OST interesting thing in up-state markets this season has been the comeback of the potato market. As this is written, spuds have been moving at up to \$1.85 a bushel and \$3.25 per 100-pound bag. All of this is without benefit of price supports, marketing agreements or other artificial devices. It will be recalled that, during the past two years, potato prices have been less than satisfactory. Last year both Long Island and Upstate New York growers turned down marketing agreements by which they might have obtained price supports, and decided to go it on their own.

This year, acreage is down and the crop is smaller, but it is still a fair-sized crop when one leaves out the government purchases of other years. There is orderly marketing; growers are not dumping their crop or running around to get in on government programs. On several days, official market reports have indicated "most stock going into storage." Prices and demand have been good, and growers are happier than they have been in several years.

The apple-pricing situation seems beyond the control of New York growers alone. Crux of the problem seems to be that Shenandoah region processors are taking in apples on open contract, price to be decided later. New York processors claim they paid too much last year, and there is some agreement that the price situation farther south is bad. In that area the open-price policy is said to follow a report that one big processor was engaged in some kind of a war to hold grower prices down. The large crop for the third year in a row also is blamed, with the net result that growers are getting about half of last year's prices and a lot of apples are unpicked.

Apple growers are trying to get the Commodity Credit Corporation to make a standby offer to processors to buy their unsold stock of apple sauce next July at prices that would reflect \$2 to \$2.25 per hundredweight to growers. For the longer pull, some growers are for exploring the possibilities of an interregional bargaining agency.

\* \* \*

### Vineyardists Complain

Grape growers complain that one of the reasons for low prices this year is the heavy flow of grapes from Canada. For reasons they don't understand, they say the duty on grapes was lowered from \$11 to \$8 per ton on Canadian grapes. In return, Canada is supposed to take some American products, but the story here is that California hard grapes get the benefit of this reciprocity while New York growers near the border feel they are hurt.

—A.A.—

### STATE AMENDMENTS—HOW WILL YOU VOTE?

**W**HEN New York State voters go to the polls on Election Day they will find 8 amendments for approval or disapproval. Here are some facts which we trust will help decide which way to vote:

**Amendment 1** makes absentee voting possible for military men in service; also their families.

It looks like a good idea.

**Amendment 2** makes it unnecessary for voters in military service, inmates in certain veterans hospitals and members of their families to register personally in order to vote.

We see no objection.

**Amendment 3** provides authority to increase the amount of pension to State employees who belong to a state retirement system. No limit is put on the amount of increase.

It seems to us that it sets a dangerous precedent.

**Amendment 4** provides for the State guarantee of bonds to construct the State Thruway. The object is to enable the Thruway Authority to make an annual saving of around 5 million dollars in interest costs.

The Thruway will be constructed whether this amendment is passed or not. \$5 millions yearly in interest costs is worth saving.

**Amendment 5** is technical; it refers to courts.

We see no objection.

**Amendment 6** is important. Fundamentally it increases the borrowing power of many governmental units in the State.

This amendment is needed to allow some districts to provide adequate school facilities.

**Amendment 7** is technical. It refers to New York City.

No objections.

**Amendment 8** permits certain judges to serve in the Armed Forces without resigning, and permits the legislature to provide temporary judges to serve during their absence.

No objection.

### Weather Helps Harvest

A long spell of mild weather has helped to get crops harvested and a lot of Fall farm work done. The one drawback has been lack of rain in many sections, although heavy rainfall in early October relieved the near-drouth situation that had affected much of Western New York. Plowing for wheat before the rain was tough in many places, but generally wheat is up and doing well. In mid-October some corn was being picked, but in most cases it was not sufficiently dry or mature for best going.

Bean growers have enjoyed an excellent period for harvesting and field-threshing, in contrast to the experience of most years when rains seemed to come at the wrong time. The tomato yield in September took a decided spurt from the lowered prospects in dry August, with the result that some receiving plants were almost "plugged" for a few days. The harvest extended much later than had been expected.

\* \* \*

### Growers Want Bargaining

Two outstanding aspects in the state farm picture this year are the success of tomato growers in bargaining with processors and the plight of apple growers. Last winter the New York State Canning Crops Growers Cooperative announced that when two-thirds of the tomato acreage was signed, members would be bound not to sign contracts with processors unless approved by the Co-op.

By early spring that sign-up had been obtained. Bargaining committees were named to negotiate prices. Some of the processors held off until almost at planting time growers did not know whether they were going to plant. Both sides stuck it out, until finally contracts began to be approved.

Tomato growers seem agreed that their co-op raised the price, that growers have the will to stick together, and that a pattern has been set for other canning crops.

Prices being offered by processors for apples are termed disastrously low by apple growers. There is considerable feeling among them that they need some kind of a bargaining agency. The experience of tomato growers has stimulated their interest in this direction.

\* \* \*

### Cannery Picketed

When one cannery firm announced its prices for apples, growers halted deliveries and picketed the plant. Several meetings were held to air the situation and finally the growers resumed deliveries at the prices announced.

# Do **ALL** your work **EASIER** with a McCormick® **FARMALL® Super C**

**Dig Holes SITTING DOWN**—for fence posts or tree plantings—with a Farmall Super C tractor. Eight auger sizes available: 4, 6, 9, 10, 12, 14, 18 and 24-inch. Mounted to dig holes *fast* and *straight down*, even on steep hillsides. Digger is pto-driven; raised and lowered by tractor's hydraulic Touch-Control system. Digs in hard gumbo, shale, roots and hard pan.

**Load Manure, Scoop Dirt — FAST, EASY!** Handles sand, gravel, lime, snow... cleans barnyards and feedlots... grades and backfills... lifts heavy objects. Loader uses three hydraulic cylinders with Super C's own *engine-driven* hydraulic pump. Two cylinders raise and lower, one dumps the bucket. Pump doesn't stop when you clutch tractor. Loader mounts in minutes.

**Plow to 8 INCHES DEEP** with this two-furrow, 14-inch Super C plow. Uses Plow Chief bottoms with low-cost, replaceable Spear-Head points and shares... Attach a 2 or 3-disk plow, or a two-row lister-planter... Or, try its *sure-footed* traction for tough draw-bar work. Pulls a 7-foot tandem disk harrow, 2 or 3-section spring-tooth harrow, 3 to 5-section peg-tooth harrow, 7-foot field cultivator.

**Plant, Cultivate, Harvest ANY CROP.** Farmall Super C plants, cultivates, sprays, bales, chops, hauls, picks corn, combines, lifts beets—does *ANY* field job. Here you see it check-planting corn with the new, ground-driven clutchless McCormick planter. This planter also power hill-drops or drills corn and many other crops. Fertilizer unit also works with the cultivator.

See your IH dealer for complete information on any of these implements. Ask too, about other odd-job implements, such as: buzz saw, rear carrying unit, digger-crane-shovel, and water pump.

## INTERNATIONAL HARVESTER

International Harvester products pay for themselves in use—McCormick Farm Equipment and Farmall Tractors... Motor Trucks... Crawler Tractors and Power Units... Refrigerators and Freezers—General Office, Chicago 1, Illinois.

Three rib front tires optional at slight additional cost.

# FORD MEANS MORE IN TRACTORS, TOO!

A name can promise sterling value; pledge lasting satisfaction; certify to an especially high type of performance. A name can stand for productive genius that has changed the course of human history. A name can represent scientific research to create new prosperity and better living.

If ever a name in business has come to mean all these things, that name is "Ford." It has held the confidence of three generations of Americans—and, particularly, of America's farmers.

The name "Ford" on a tractor today has a meaning even beyond all this. It means volume production resources unique in the farm

equipment field—engineering leadership to keep ahead with new developments—low price and a generous measure of extra value for that price.

And, finally, the name "Ford" is the symbol of a sound investment, for a Ford Tractor, even after years of use, will still bring a good price.

## Ford Tractors and Dearborn Implements... THE IDEAL WORKING COMBINATION

Dearborn Implements are designed to team with the Ford Tractor, to give you faster, easier, more economical operation and better work on a surprisingly wide variety of jobs. Let your nearby Ford Tractor dealer prove what a Ford Tractor can do for you—by an actual demonstration on your farm.

# Sheep Bring Back Marginal Acres

By BILL STEMPFLE

A SUCCESSFUL livestock ranch on land that the experts had adjudged unsuited for farming is the proud accomplishment of George Russell of Cameron in Steuben County, New York. Owner of 350 hilltop acres that borders on what is known as the Swale, an area classified as marginal by the land use study some years ago, "G. R." farms in a region where abandonment started in 1861. The first of two farms, a tract of 234 acres, was acquired in 1935 and the second in 1942, at a cost of less than ten dollars an acre.

Starting with sixty-five sheep, Mr. Russell financed his operation in the early years by doing custom work. He told me: "I plowed and fitted land, sowed and harvested crops and baled hay and straw. Times were tough and it was nip and tuck to feed the family and pay the meager expenses. Many a time I thought I would surely fail."

## Business Grows

From that meager beginning, George Russell has increased the flock to its present number of 330 head, of which 185 are ewes, and has developed a herd of 38 Hereford cattle.

The sheep are Suffolk and Shropshire, to which Suffolk rams are bred because the lambs mature faster. "They go to eating grain as soon as they are weaned," is the way George puts it.

The flock and herd will be gradually increased to 200 breeding ewes and 20 brood cows, which is about the capacity of the farm's present proportion and the available labor supply. If either or both of his sons should decide to farm with their father, Russell would enlarge the operation.

The poverty of the farm in its original state and the improvement Russell has effected may be understood by comparing the three jags of weedy hay gathered the first summer with the 110 tons of prime clover and mixed hay harvested this season. Then, too, he has produced 2,500 bushels of oats that yielded 70 bushels to the acre.

The tremendous increase in productivity is the result of lime and fertilizer and good farming. And the end is not yet in sight because Russell has proven to his satisfaction that one ton of lime in three years is not enough to grow the quality and

amount of roughage required. He intends to use substantially larger amounts of lime in the future.

## Markets Through Pool

For three years Russell has sold the lambs through the Pool operated by the Empire Livestock Marketing Cooperative at Bath, which he finds to be his best market.

"You get paid for what you've got," is his appraisal of the Pool, and he is entirely satisfied with the grading. And with good reason, because the Russell lambs always grade well above average.

A recent visitor to the Russell farm

Donald Russell and a lamb on his dad's farm.

was Bob Rector, the sheep specialist of "Empire" and manager of its Caledonia market. A native of the Buckeye State, Rector has worked the lamb deal in Ohio for the past fifteen or twenty years and is thoroughly conversant with conditions there. For the past several years he has lived in the lush Genesee country; yet in late summer he found that George Russell had more and better feed for his sheep and cattle than the farmers in the more fertile land areas of the state.

"George Russell has demonstrated that sheep and beef cattle can be successfully produced on the poor soils of the Southern Tier," says Bob Rector, a statement with which those who are acquainted with Russell's operation achievement are in full accord.

## BUYING BEEF FOR FROZEN STORAGE

Will a beef forequarter be a better buy than a hind when it sells for 10c to 12c a pound less? The answer to that will, of course, depend on what you want most from your beef. If it's lots of steak you want, then the hind is the only choice. Hinds of choice beef can give about 60 per cent steak, while forequarters give only about 25 per cent by using the rib and best parts of the shoulder. Even then the forequarter steaks will be less tender than those from the hind.

The forequarter does have some things in its favor, however. It costs less and it gives about 8 to 10 per cent more kitchen ready cuts. If your family will eat some of the richly flavored fat in the shoulder pot roasts, the forequarter will furnish much more economical meals. Should you have all "Jack Sprats" sitting at your table, choice beef will give you about the same per cent of meat from the fore as from the hind. Jack would have to consider only the price difference and the tenderness. His wife and he together would find considerably more meat for

less money in the forequarter.

The amount of steak and roast meat from different grades of beef is available from Cornell Animal Husbandry Extension by writing your county agent.—G. H. Wellington.

\* \* \*

## CATTLE DRESSING PERCENTAGES

The dressing percentage or yield of livestock is always variable because it is dependent on many things, including amount of fill, finish, type and other factors. The Office of Price Administration chose the following as average cattle yields:

Prime .....	62%
Choice .....	59%
Good .....	56%
Commercial .....	53%
Utility .....	47%
Cutter .....	43%
Canner .....	43%

Since cattle butchered at home are often not weighed alive, these percentages may be helpful in estimating live weight from the carcass weight.

—G. H. Wellington

## LEACH SILO UNLOADER

Six years of proven service. Built with reserve strength and power to bring down hard-frozen silage. Double booms give high unloading capacity. Handles corn or grass silage. Rugged construction assures long life and dependable operation. Pays for itself in 2 years. Mail coupon.

## Paul Rigoni Built A Pond

THERE are many outstanding examples of good farm pond construction in New York. On Paul Rigoni's farm at Pavilion, Genesee county, an unusual hillside sky pond attracts much attention. During construction it was the subject of more discussion and criticism than any other single practice ever established in the district. However, it does the job for which it was created, and is a monument to a farmer's unswerving faith in the "know how" of the district's SCS technicians.

Mr. Rigoni was in desperate need of a water supply for his 40 cow dairy herd. He had spent several hundred dollars for drilled wells, without satisfactory results. Under all conditions of year-round weather, he had to drive his herd to four shallow wells located at a considerable distance from the barn. The supply was unreliable. This and the time consuming service were doing everything to his milk check but lifting its face value. He asked the district for assistance in building a farm pond.

### Pond on Sidehill

Since the house and barns are located on the highest part of the highest hill on the farm, and because the surrounding soil is sufficiently heavy to hold water, it was decided to locate the pond near enough to the buildings so that water could be drawn with a shallow-well pump located in the cowbarn. These simple hydraulic calculations by the technicians saved Mr. Rigoni several hundred dollars in pumping installation costs. The site was 400 feet from the barn on the side of the hill. Success depended upon getting enough surface water from less than two acres of improved pasture to keep the pond reasonably full. Designed to cover six-tenths acre of pond surface, with a maximum depth of 8½ feet, and a capacity of about 600,000 gallons, it was completed at a total cost of \$370.

The pond was built in four days in September 1947 by moving approximately 2,300 cubic yards of earth with a 20-ton bulldozer. Mr. Rigoni immediately hired a backhoe and ran a 1½ inch pipe from the bottom of the pond to the barn, where automatic drinking cups had been installed on the stanchions. When December winds began to blow, the stock water service system was in operation with enough water in the pond to supply the herd during the entire winter.

### Soon Pays for Itself

Mr. Rigoni enthusiastically tells all comers: "The pond paid for itself in less than a year. One extra can of milk was obtained from my herd every day, because the cows drank more water and did not have to work to get it. That's \$4.60 extra cash money every day at prevailing milk prices."

There are other reasons for his satisfaction with the pond. It is only 60 feet from the road. In a matter of seconds fire apparatus could be playing water on the buildings, should this need ever develop. Every summer evening, the Rigonis two older sons, Alfred and Ernest, enjoy a refreshing swim after a hard day's work. The pond has been fertilized and stocked with bass and blue gills, obtained through the Genesee Soil Conservation District. A multiflora rose living fence has been planted around the pond to replace, in a few years, the wire now strung to exclude livestock. It will lend additional beauty to this hillside spot of quiet water.

— A. A. —

Farming has moved up from fourth to third place as the most dangerous way of making a living: About 55 of every 100,000 workers engaged in agriculture are killed accidentally every year. Only the construction industry, mining, and quarrying had higher occupational death rates.

# Here's what America's railroads have added in the last six years:

## From the Editor's MAILBAG

### SELL MORE APPLES

IN REGARD to your editorial about increasing the demand for apples, we want to say we are apple growers and appreciate your interest and your idea of making the consumer and producer more conscious of quality apples.

We have friends in northern New York who will tell you that that area has been peddled for years with poor apples at high prices. They no longer will buy apples from the vendors by the bushel, but instead go to the store for 3 to 5 lbs. of apples. These people and I'm sure others would buy more than a few apples if an honest vendor would devise a method by which the customers would be sure of the product they were buying.

We suggest that a vendor who wants repeat sales could overcome the sales resistance to his apples by:

1. Carrying both bulk and packaged apples.
2. Telling the customer about varieties and their uses.
3. Packing the fruit while the customer watches.
4. Giving the housewife and youngsters sample apples to eat.
5. If all else fails, allow the customers to watch him eat an apple letting the juice drip off his chin.

Also, why wouldn't several well located "Apple Harvest Festivals" aid in making the public more conscious of quality apples?

On the educational side, the growers, packers, processors and merchants could give their part of the apple story in displays and demonstrations. Entertainment could be provided by:

1. Parade sponsored by schools and local organizations.
2. Some other midway attractions converted to the apple theme.
3. Music by school or firemen's band.
4. Singing by groups or quartets from among our southern apple pickers.

6. Choosing an "Apple Queen."

We feel sure a festival would be fun as well as a method of promoting the sale of apples.—Mrs. Charles Fournier, North Rose, New York

—A.A.—

### THINK BEFORE YOU PACK

YOUR editorial "Let's Increase Demand for Eastern Apples" interested me both as the wife of an apple grower and from the consumer standpoint. Blue Hills Farm wholesales only, but as a wholesaler and packer it has been necessary to study the retail end as to the handling of fruit as well as the quality appearing on the retail shelves.

It has not been necessary for us even in these years of so-called over-production to dump apples because there was no market for them. The reason has been that at harvest time apples go to their right place—the poor quality to cider mills; the poor-shaped, sound apples to processors; and the good sound ones are graded and packed. The harvesting of apples is closely watched to prevent bruising and is done only by the hour; no piece work. The grading and packing of apples for both local buyers as well as shippers is found to be equally important, and the bottom of the box is always equal to the top layer.

The education of the retailer as to

the variety is less essential than as to the mode of handling. We have seen them handled like baseballs in places from here to Florida. Some apple organizations have gone in heavily for advertising apples both on radio and TV. Of course, TV shows fine sound round apples; this will not interest the consumer if the retail shelves offer bruised or unsound apples, octagonal in shape from poor packing.

The sale of drops, we feel, is a detriment to the marketing of sound apples. "Why," asks the housewife, "should I buy the higher priced apples if I can get the cheap drops?"

From the outlook of a consumer and as the wife of a grower and packer, it seems to me to sift down to a few musts:

Grow, pick, grade and pack so the consumer can buy round, sound, good apples.

Dump at picking time what should be dumped.

Let the cider mill have what it should have. In grading and packing, remember the retailer expects to sell the bottom layer too.

In other words, think before you grade and pack.—Mrs. Louise Henry, Wallingford, Connecticut.

—A.A.—

### REAL COURAGE

FOR the past several years you have been so good to me that I am reluctant to ask you more favors, but my little mail order business has been built with your continued help. How proud I am to be able, with the income derived from the sales of my greeting cards and magazine subscriptions, to pay my hospital and doctor's bills myself and not depend on any charitable organizations! (And what bills I've had to pay as I am constantly under the doctor's care).

Each time you have inserted a notice in your paper for my magazine subscriptions and greeting cards it has brought me nearly 100 new names. They are loyal customers and are indeed satisfied with my cards.

—Leopold Roy, Richmond, Vermont

EDITOR'S NOTE: For the past two years we have broken a long-standing rule in calling attention editorially to Mr. Roy's business. We did so only after verifying the facts that Mr. Roy has been bedridden with arthritis for 20 years and, as he says, is doing his best to be self-supporting. We admire his courage and we know you will too. On request, he'll send a list of the cards he has for sale.

"Soap? Goodness, Willie, is it Halloween already?"

## Director Simons Honored

**F**ORTY years ago L. R. Simons, now Director of Extension for New York State, started as a teacher of vocational agriculture at Gowanda, Cattaraugus County, New York. Some months ago his old friends at Gowanda planned that he would be the guest of honor at the annual Gowanda F.F.A. Father and Son banquet Tuesday evening, October 30th.

High school vocational agriculture has had many changes since 1911, but great credit is due to the men who pioneered, and it's especially pleasant to have the opportunity to honor a man like "Si" Simons who has gone on to make his influence felt in other fields.

"Si" headed the agriculture department at Gowanda for three years. In 1914 he became County Agricultural Agent in Nassau County, Long Island; going from there in 1916 to become a specialist with the U. S. Department of Agriculture. In 1920 he became assist-

L. R. Simons

ant state leader of county agricultural agents in New York state. In 1928 he became state leader and was appointed director of Extension in the Fall of 1932.

He has served in many capacities in connection with the work of the Association of Land Grant Colleges and Universities of America. These have included secretary and, later, chairman of the extension section; chairman of the older rural youth committee; member of the important committee on extension organization and policy, of which he was chairman in 1941.

In 1936 Director Simons was awarded the Certificate of Recognition by Epsilon Sigma Phi, National Honorary Extension Fraternity; in May, 1944, he was given the Degree of Empire Farmer by the New York State Future Farmers of America; in November, 1944, he received the American Farm Bureau Federation award for distinguished and meritorious service in the interest of organized agriculture. In 1946, he was awarded a Citation for Outstanding Service to 4-H, and in September, 1950, he was cited by the Syracuse, New York, Chamber of Commerce at its annual Farm Dinner in "recognition of his outstanding service to agriculture and in recognition of the esteem he is held in by his fellow-citizens."

On May 15, 1951, Director Simons received the U. S. Department of Agriculture's Superior Service Award "for unusual service as a leader in extension organization and methods."

The above list of honors which have come to Dr. Simons is the outward acknowledgement by his associates of the regard in which he is held and the service which he has rendered.

*Dairymen's League Annual Meeting Asks*

# HIGHER RETURN for Milk Producers

## Adopts Resolutions for Higher Milk Prices, Reduced Country Plant Expense, and Maintenance of Import Bars on Foreign Dairy Products

Costs of milk production are outrunning returns to producers, said delegates to the Dairymen's League 32d Annual Meeting. Prices to consumers are high, the delegates admitted, but pointed out that a week's wage in industry will buy today from 63 to 96 quarts more milk than it would 10 years ago. Therefore, the Meeting resolved . . .

**"... a higher milk price to producers is necessary and should be obtained even if it means charging a higher retail price."**

The Dairymen's League delegates were willing to meet consumers more than half way, however, in an attempt to solve the problems posed by mounting costs. Said they:

**"RESOLVED, That the Board of Directors be urged to study the possibilities of effecting savings in our country operations by consolidating volumes of milk from adjacent plants to a central plant where the combined volume would make possible full use of manpower and equipment."**

The delegates had their eye on the international situation, too, particularly on the "increasing imports of dairy products" that "are seriously endangering the normal price structure within the United States." Declaring that such importations threaten to increase Government support buying and that the Congress is now considering repealing a provision of the Defense Production Act which sets up standards of reasonable import controls, the Meeting . . .

**"RESOLVED, That we oppose any change in the existing law."**

Further, in their efforts to stabilize the dairy farmers economic position, the delegates passed resolutions disapproving the sale of colored oleomargarine in New York State, and the practice of removing butterfat in whole or in part from evaporated milk, cheese and ice cream, and substituting therefor vegetable oils. They urged the maintenance of all existing regulatory laws both Federal and State to eliminate this last named abuse with its resulting frauds. And they opposed as taxpayers in a major dairy state, the sole use of oleomargarine on school lunch programs and in state institutions.

### You Are Invited to Join In This Program

Resolutions adopted at the Annual Meeting of the Dairymen's League reflect the thinking of members on problems affecting the welfare of all dairymen. They set the pattern of action for its elected officers during the coming year. League members invite all interested dairymen to join with them in carrying out the aims expressed.

# Ask your druggist for these 2 proved treatments for MASTITIS

## NOTE THE THOROUGH DISPERSION OF SQUIBB OINTMENT IN A TREATED QUARTER SQUIBB PENDISTRIN\*

Each tube of Squibb PENDISTRIN contains 100,000 units of penicillin plus 100 mg. of dihydrostreptomycin. This potent combination of antibiotics makes PENDISTRIN especially effective for nearly all kinds of mastitis cases—and particularly those caused by Staphylococci. PENDISTRIN is stable, non-irritating, won't discolor milk. It comes in the "instant-use" tube—requires no refrigeration.

## SQUIBB PENICILLIN OINTMENT

This is now a 3-year success in treating 9 out of 10 cases of mastitis (those caused by Streptococcus Agalactiae). Millions of cases have been successfully treated. This product is stable, non-irritating, won't discolor milk. Write for special literature on PENDISTRIN and PENICILLIN OINTMENT. E. R. Squibb & Sons, Veterinary and Animal Feeding Products Division, Dept. AA-11, 745 Fifth Avenue, New York 22, N. Y.

For accurate diagnosis of mastitis, consult your veterinarian.

# League President Chapin Expects High Milk Demand

**M**ORE than 2,000 dairy farmers attending the 32nd Annual Meeting of the Dairymen's League Cooperative Association at Syracuse, N. Y., re-elected all directors, acted on many resolutions pertaining to both business and government, and heard their President, Leon A. Chapin, predict "a steady and perhaps rising demand for milk and milk products during the year ahead."

Mr. Chapin reported net sales for the fiscal year ending March 31, 1951, of \$149,141,637, an increase of \$6,500,000 over the previous year.

## Manufacturing Important

Pointing out that 8 of the Association's 13 plants for manufacture of dairy products operate only part of the time because of fluctuating demands of supply and fluid production, Chapin sounded a note of criticism of the New York City federal-state milk marketing orders.

"With a capacity of 3,000,000 pounds daily," he said, "our manufacturing plants are of prime importance not only to this Association but to the entire industry. These facilities, and our disposition to use them in market stabilization, are widely acclaimed as a major factor in protecting all dairy farmers from a possible collapse during the flush periods. Still we are unable to collect from the New York City federal-state marketing orders adequate compensation for providing this protection to all producers. In vain the justification for adequate compensation has been proved by detailed facts and figures at hearing after hearing.

"With industry and commerce in what may prove to be the greatest boom ever known, with the working population at the highest figure in history, and with labor receiving unprecedented high wages, we can anticipate a good demand for our products. Our costs will continue to rise as long as inflation continues. Our greatest difficulty will be in obtaining milk price advances as costs go up. We are confronted by governmental price regulation, which aims to keep food prices down, and the natural resistance of consumers to rising prices.

"To convince these forces that dairymen must have fair prices is the constant task of the Dairymen's League. We work at it daily. No other producers' organization in this area works so steadily, so insistently, and I might well say successfully, at this task as does this Association."

In resolutions adopted by the delegates, the Dairymen's League went on record:

## In favor of:

A higher milk price to producer even if it means charging a higher retail price. Greater farmer representation on draft boards.

Wider advertising and publicity.

The enactment of legislation by the State of New York similar to that of other states in the milk shed which, with the approval of Congress, will permit the several states in the milk shed to enter into a compact or compacts for the joint control of prices of milk to producers, in case federal regulation under the Agricultural Marketing Agreement act of 1937 is terminated.

Departing from its usual custom of taking actions that pertain only to the dairy business, the League called upon all public office-holders "to start peeling, instead of padding, the public payroll and thus release men and women for productive work," and demanded that immediate steps be taken towards lowering taxes. In support of the demand for lower taxes, the Resolutions Committee stated that "men in government are pursuing a reckless course in enlarging the public payroll."

Pointing out that the threatening peril to the nation can be met as it was in

World War II without the sacrifice of any of the essential freedoms, and that freedom of speech and freedom of the press are two rights that the American people must never surrender, the League went on record as calling for rescinding of a recent federal order restricting information on government activities.

## The League opposed:

Any law that will permit the sale of colored oleomargarine in New York.

The use of oleomargarine in the school lunch program and in state institutions. Daylight saving time.

The following members of the Board of Directors were all re-elected to 3-year terms: Grover C. Guernsey, Schoharie, N. Y.; Floyd E. Washbon, Cazenovia, N. Y.; Fred H. Sexauer, Auburn, N. Y.; Jay D. Sholes, West Edmeston, N. Y.; Meryl O. Marsh, Marilla, N. Y.; H. L. Seeley, Knoxville, Pa.; Edgar Raish, Candor, N. Y.; G. W. Slocum, Milton, Pa.

At the close of the Convention the new Board of Directors met and re-elected all officers as follows: Leon A. Chapin, North Bangor, N. Y., president; Paul L. Talbot, Burlington Flats, N. Y., first vice president; L. M. Hardin, Sussex, New Jersey, second vice president; A. Morelle Cheney, Bemus Point, N. Y., secretary; Ernest C. Strobeck, Macedon, N. Y., treasurer; and Stanley H. Benham, Millbrook, N. Y., assistant treasurer.

The Executive Committee is composed of Leon A. Chapin, Ernest C. Strobeck, Stanley H. Benham, Grover C. Guernsey, and A. Morelle Cheney.

## Young Cooperators

During an evening Dairymen's League program, E. R. Eastman, editor of this paper, presented the AMERICAN AGRICULTURIST 4-A Awards to two outstanding Young Cooperators for demonstrated leadership and ability. These went to:

Vernon Wahl, 20, Callicoon, N. Y., who was Junior Delegate of his Dairymen's League local, helped to start a Young Cooperators group in his local, and who now has a 98-acre farm with 38 Holstein cows; and to

Elizabeth Mary White, 16, Chaumont, N. Y., who has been an outstanding leader in Young Cooperators and who won the Babe Ruth Foundation medal for sportsmanship, leadership, and scholarship.

Editor Eastman presented both of these young people with engraved gold medals.

Vice President Paul L. Talbot paid tribute to the late Henry Rathbun's love of young people when he presented the annual Rathbun Memorial Awards to James W. Schoemaker, 21, of Mt. Bethel, Pa., and James B. Brayton of Poughkeepsie, N. Y. Schoemaker, who recently moved onto his own farm, has been active in Young Cooperators nine years and is vice president of the executive committee. Brayton, who won in the 14 to 18 age group, is vice-president of Vermont Young Co-ops, leader of his 4-H Club and a senior at Poughkeepsie High School.

Elected to the Young Cooperator executive committee were: Robert Miller, Knoxville, Pa.; Guy Haviland, Middleburg, N. Y.; Ray Cooley, Norwich, N. Y.; Edwin Hadlock, Hammond, N. Y.; William Howard, Wyalusing, Pa.; Lloyd Hayner, Cornell, and Elizabeth White, Chaumont, N. Y.

—A.A.—

**A**MIMEOGRAPHED bulletin setting forth information on growing birdsfoot trefoil is available, free, to our readers. The facts are based on successful results that practical farmers have had with this legume. For a copy, drop a card or note to AMERICAN AGRICULTURIST, Savings Bank Bldg., Ithaca, N. Y.

From left to right: Richard Chase, David Frost, Charles Dusen, LaVerne Cone, and Thomas Brodie. Front row: Francis Mathews, Melvin J. Merton, and Donald Gray.

## A Rotary 4-H Pig Club

WHEN Francis Mathews approached Dick Chase of Stafford, N. Y., a member of the LeRoy Rotary Urban Committee, with his idea for a Rotary 4-H Swine Club in the spring of 1950, it was readily accepted. One reason was that Francis had joined the Genesee County 4-H program in its inaugural year, 1923, at the age of 8 and stayed in till he was twenty-one, when he became a Farm Bureau member. He has three children, with two old enough to be 4-H members. He is an Elder of the Presbyterian Church of LeRoy, N. Y.

Dick is head man at the Stafford Egg Laying Plant. Francis said he would donate a small sow pig to LeRoy Rotary each year and that boys who had received sows in previous years would donate to 4-H boys se-

lected by Melvin J. Merton, long-time 4-H director of Genesee County.

In 1950, Thomas Brodie, 18, of LeRoy, and LaVerne Cone, 15, of Stafford, received pigs. This year LaVerne donated one of his pigs to Charles Dusen, 10, of LeRoy. Tom Brodie donated one of his to David Frost, 13, and Rotary and Francis Mathews donated another to Donald Gray, 14, of LeRoy.

Mr. Merton helps these boys in their activities which are sow-testing, County Fair exhibiting, fat stock shows and livestock judging.

Mr. Mathews and the boys were guests at a recent Rotary dinner when Mr. Merton gave a report of their doings to date. The pigs are purebred Yorkshires.—Philip E. Tompkins, LeRoy, N. Y.

## Sure Ways to Machinery Breakdowns

THERE are ten sure-fire methods of handling farm machinery to insure its breakdown, farm machinery dealers say. The dealers feel sure of these methods, even though they seem relatively harmless, since from 45 to 85 per cent of farm machinery breakdown in the past trace directly to them:

1. Don't check the tires. Let them go flat. They'll shake the engine to pieces faster that way.
2. Don't stop for fences with a combine or a corn picker. Keep going. That is a sure way to spring the frame.
3. Don't clean the filters. Your engineer will wear out several times as fast when the filters are clogged.
4. Let the loose bolts alone. They'll fall out some day and then the breakdown will not be far off.
5. Use baling wire or any piece of scrap iron as a substitute for a broken part. Soon you'll have lots of scrap iron for further repairs.
6. Keep going no matter how much the machine rattles and pounds. Adjustments take time. There won't be much time to the next breakdown.
7. Skimp on grease. That way, parts wear out faster and break sooner.
8. Let it rust. This is a sure-fire way to the scrap heap.

9. Don't ever clean your engine. Let the dirt-filled grease pile up. It will cover up small defects so that you'll have a big breakdown instead of a little one.

10. Speed up the pulleys while you skimp on the grease. This has never failed to cause a major breakdown.

—Lucien Paquette

—A.A.—

## MORE HOME-GROWN GRAIN

In 1950 New York State Dairy farmers fed 1,300,000 tons of grain to cows. During 1950 every cow in the State averaged to get 1,990 pounds of grain, slightly less than in 1949. Of the grain fed 22 per cent or 286,000 tons were home grown. There has been a big increase in home-grown grains, the amount grown on New York farms in 1950 being two-thirds larger than the average amount grown between 1944 and 1948.

There have been a number of good reasons for this including increased freight rates, government support of grain prices, and increased efficiency of growing in the Northeast due especially to the development of mechanical corn pickers.

## Question Box

What causes wet litter in chicken houses?

There are three sources of moisture. One is the moisture given off by the birds themselves. Second, is the possibility that moisture comes up through the floor by capillary action. Third, is the moisture which comes through the windows or through leaks in the roof or is spilled by water fountains.

The remedy for water that comes through the floors is construction to prevent it, or remodeling which usually means laying tar paper and putting on another thin coat of concrete. The remedy for windows, roofs, and fountains is obvious although not always easy to control 100%.

You can do nothing about the moisture given off by birds except that you must remove it. Ventilation of poultry houses to remove moisture is somewhat more difficult than ventilating a cow stable because the weight of the birds in relation to the air space is relatively small and heat given off is often not sufficient to maintain circulation of air. For that reason the trend is toward ventilation by electrically operated exhaust fans.

How much feed does it take to make a 35-pound pig weigh 200 pounds?

Tests have shown that it takes about 480 pounds of ground corn, 66 pounds tankage, 31 pounds linseed meal, 31 pounds ground alfalfa, 1 pound mineral mixture and 1/2 pound salt. If table scraps, garbage, skim milk or other waste feeds are available, these figures can be reduced.

—M. D. Lacy

Why is there so little spring wheat grown in the Northeast?

The main reason is that the yield is usually less than winter wheat or less than oats or barley. Some tests at Cornell made over a period of 7 years gave the average yield of 10 best spring wheat varieties as 954 pounds per acre and for the same period the average yield of the 10 best oat varieties was 2,025 pounds per acre and for the 10 best varieties of barley, 2,145 pounds. For the same period, the average yield for the 10 best winter wheat varieties was 2,250 pounds per acre.

What do you think about the idea that use of chemical fertilizer is bad for the soil and that crops grown with fertilizer are bad for animals and humans?

No one has ever questioned the value of organic matter in growing crops. However, anyone who examines the facts carefully must, we think, conclude that food production would drop to an alarming degree if the use of commercial fertilizer were discontinued. There is no evidence that the plant food elements in fertilizer are any different from those contained in humus.

## Cash In On Winter Milk!

## Feed KAFF-A

...the safe replacement for cow's milk!

Feed Kaff-A to your fall calves . . . and sell your cow's milk during the season of highest prices. Don't lose any of the profits of fall freshening by feeding costly winter milk to your calves.

Kaff-A is the safe replacement for cow's milk in calf feeding. A 50 lb. box releases up to 500 lbs. of whole milk for you to sell. Start Kaff-A the fifth day and from the 10th day you can sell all your cow's milk. Fall calves don't need it . . . and they do need the extra protection in Kaff-A. For Kaff-A is made from nutritious buttermilk, other dairy products, some cereal products and guaranteed, stabilized levels of Vitamins A and D to replace summer sunshine and flush milk from green pastures.

Don't risk your calf's health or lower resistance to winter drafts and cold. Feed genuine Kaff-A and be sure that your fall calves get the nutrition that develops good milkers . . . good breeders. Two million healthy heifers have already been raised on Kaff-A. Get a pail or box from your feed store or milk plant today.

### Lest We Forget

1. That low prices were no good either.
2. That our farm is our workshop.
3. That good farm workmanship is still work.
4. That the kitchen is the most used area on the farm.
5. That the "superintendent" of that area works more hours than you do
6. That there are no shiftless animals.
7. That "good doing" livestock always belongs to a "good doing" farmer.
8. That our animals are entirely dependent upon us and they know it.
9. That unless we give them a sense of care and security they worry and fret.
10. That worrying animals are no good as pets or producers.
11. That for every extra hour you work for them, they will work two for you.
12. That your fields even pay time and a half for overtime work on them too.
13. That these dollar returns help but are apt to soften callouses.
14. That there are the right animals for you and for your farm.
15. That on some farms a little "50-pound" cow is better than a big "60-pound" one.
16. That quality is more important than size in man or beast.
17. That God gave our farms grass, but better grass is our job.
18. That machinery deposits no enrichment.
19. That everything costs more except what you do yourself.
20. That easy chores at easy hours do not make easy money. . . but that easier chores at easier hours are long past due.
21. That what seems too high today may be too cheap tomorrow, or that what's too cheap today may be cheaper tomorrow.
22. That your worry and my worry never changed the price of anything, so why worry?
23. That bureaucrats are not gods, either.
24. That livestock prices are now all below their set ceilings "to stop inflation." Let us laugh.
25. That your pets tell more about you than gossip neighbors.
26. That these pets, your animals and anything you have now have real dollar value.
27. That the page across the way from this is at your service to get that value. Use it!

— A. A. —

### "STRAIN 19" VACCINATION

Some recent tests at the Beltsville, Md., Experiment Station show that cows vaccinated with "strain 19" vaccine may retain immunity to brucellosis (Bang's disease) longer than originally thought. The tests showed that vaccinated cows had a resistance to brucellosis even after their 5th calf. Experiment was made on 93 cattle vaccinated between the ages of 6 months and 2 years.

The report also said that there is no conclusive evidence that revaccination will provide added protection at any age. A report on the experiments was given by Dr. C. A. Manthei of the U. S. Bureau of Animal Industry at the recent convention of the American Veterinary Medical Association.

# Lighter... Faster... Tougher

It's the NEW  
**HOMELITE**  
ONE MAN  
Chain Saw

27 lbs.,... 4 H.P.  
More power per lb.  
than any other saw

It's the newest and the best . . . lighter and easier to handle. Yes and faster, *much faster*. Cuts an 18 inch tree in 16 seconds. Cuts trees 48 inches or more in diameter. It's a one-man saw that really does the work of other two-man saws. And whether you're felling, bucking, undercutting or notching, this new Homelite Saw will give you greater output because of its easier handling, less fatigue on the operator and greater productive power. Built and backed by Homelite, manufacturers of more than 300,000 gasoline-engine-driven units. This new, rugged, lightweight saw is the one saw that will give you more cutting with less maintenance than any other saw. We can prove it. Ask for a Free on-the-Job Demonstration.

# Let Your Children Make Things

## No. 2: Modeling in Clay

By Dorothy Welty Thomas

CLAY BALLS  
and "SAUSAGES"  
for MAN

Older children will aspire to anything. A woman with a bustle and curls under a bonnet will not stop a ten-year-old girl. All children love to make animals, especially the prehistoric ones with scales on their tails!

When a child is eight or nine, suggest that he make a man that will stand alone, like the clay man at the left. Stress his strength rather than his perfection. A ball for the head, sausages twice that size for arms, legs, and body, and balls for hands and feet. The feet should be exaggerated enough to support the rest of the soft clay figure.

Don't try the impossible. Urge older children to get action and sturdiness, and to get an "idea" into what they make, rather than perfect detail. To attempt the impossible and fail is discouraging. A farmer with a basket of eggs, a woman with a hen under her arm, a boy in overalls feeding chickens, a big boy in a turtle-neck sweater

Anybody who can make a human figure can work out his own system for a cow, horse or dog. Emphasize the characteristic features of each animal and simplify all else. Give the horse a long arched neck, and small pointed ears. Call attention to the "crooked" hind legs of most four-footed beasts. A dog with long ears and a long tail, such as the hound in the drawing below is a good one to try. Elephants are easier than pigs because they have thick legs.

Children love to illustrate whatever they are interested in at the moment. At Sunday school they could make the camel and sheep for the manger scene at Christmas, and all else for that matter. Little boys always like to make airplanes, guns, rockets and dugout canoes! Whatever the child's interest, it will come out in the clay, and that is where its value lies. An idea well expressed is worth a hundred that stay bottled up inside.

Modeling clay costs from 40c to 60c per pound package and is usually wrapped in quarter pound units inside the pound carton. Three well-known makes are Clayola, Permoplast and Plasticine. Each brand has its good points, and one kind or another can usually be purchased where stationery is sold. If not available in your locality, send to any school supply house for it, such as American Crayon Co., Sandusky, Ohio, or the J. L. Hammett Co., Lyons, N. Y. When ordering ask for a list of colors, as modeling clay comes in a large assortment. Brown, green, white, red, yellow and blue are popular with children.

ONE of the most delightful and satisfying materials through which a small child may express his ideas is modeling clay. It comes in many colors and stays pliable. Cold weather will harden it slightly and excessive heat makes it very soft, but ordinary room temperature keeps it just right for the small child to make things that will hold their shape indefinitely.

The pre-school child should be allowed to unwrap the bright colored stick of clay and handle it as much as he likes. It will become soft and pliable in his warm little palm. You take a piece and work with it while he works another. Don't tell him to make anything. Just make something yourself and show it to him, and he will want to do what he sees you do or something else it suggests to him. Let him do what he likes.

Roll part of your clay into a ball, put your thumbs in the center and work the lump round and round until it makes a little "nest." Then take smaller pieces of clay and roll into elongated balls for "bird's eggs." If you have more than one color of clay, Johnny will delight in making eggs of a contrasting color to go in his nest. Then comes the bird. Make two balls, one larger than the other. Pinch out the tail on the larger ball and the beak on the smaller piece. Put the head on the body, the bird on the nest, and twist a pencil in the sides of the bird's head to make his eyes!

A turtle is a favorite project for 5 to 8-year-olds. Make a ball of clay and

flatten it into a pancake. Make another cake a little larger; three inches in diameter for these is a convenient size. Then roll six small balls and elongate them. Roll one to a point at one end. Attach these to the smallest pancake as the head, four legs, and tail of a turtle. Clap the shell on his back and mark a shell pattern with a pencil if you like. A scalloped edge will make a nice finish for the hard-shell back. Little folk delight in making whole families of turtles and then a "pen" to keep them in. They will devise the latter. Let them do it the way they like and then tell you about what they have made.

Never criticize even the crudest attempts. The benefit to the child is in the making, not the product. And the most unpromising child artist will eventually surprise you some day. Children who seem to have no other idea than to make "snakes" will one day produce something amazing.

A snake, of course, is the easiest of all things to make. The youngster may be afraid he can't do anything else, and if you say anything you may scare the urge back into him and seal it up tight. One little first-grader cried the first day of school because he couldn't make anything. His teacher showed him the nest and eggs she could make. She put a ball into his hand and rolled another in hers. He rolled and she rolled while she talked about what she was going to make. Soon she had made the nest and put eggs in it and the first thing she knew he had made one, too, and the big tears rolling down his cheeks disappeared in a happy smile.

*Now I know what I've been missing!*

Procter & Gamble's Exciting, New  
**CHEER**

specially made for  
**"Tough-Job"**  
**Washing**

**Brand-new and wonderfully different!** Procter & Gamble's most exciting washday discovery in more than 100 years! CHEER is sensationally *different*—specially made to do "tough-job" washing as no soap you've ever used can do it!

**Like magic for tough washes—all washes!** Watch new CHEER tackle the washing you dread most—and turn it sparkling clean. Test it on grimy work clothes . . . dirt-smeared play clothes . . . grease-stained towels. Once you see how new patented CHEER suds get these "tough jobs" cleaner in hardest water, you'll see why CHEER gets *all your wash* so wonderfully clean.

**Here's the secret!** New formula makes CHEER *different* from any washing product you've ever used! CHEER is specially made with the *extra power* you need for your *extra-tough* washing jobs!

**Safe for colors, too!** With all its "tough-job" washing power, new CHEER is *safe* for colored washables, *kind* to hands!

Keep CHEER on hand! Get the Giant Economy Size Package

Wonderful for No-Rinse washing, too!

**No matter what soap you're using now,  
CHEER guarantees a CLEANER, WHITER wash**

**Double-your-money back** if you don't agree that new CHEER does "tough-job" washing better, gets *all* your clothes CLEANER, WHITER in hardest water than any brand of soap you can buy. For CHEER's *extra washing power* not only removes grease and graying dirt, but dulling soap film as well. Try it next washday!

## More Get-Up-And-Go with Domino!

Plenty of action is what most children thrive on! Easy to see why so many mothers choose Domino Extra Fine Granulated Sugar—more than 99½% pure food-energy! Help keep your active children, your busy husband brimming with life and pep. Give them Domino—America's favorite sugar!

Only **ONE** Sugar is  
**Domino Pure!**

Oscar W. Ford, R2, Ellsworth, Me.

## Personal To Women With Nagging Backache

Nagging backache, loss of pep and energy, headaches and dizziness may be due to slow-down of kidney function. Doctors say good kidney function is very important to good health. When some everyday condition, such as stress and strain, causes this important function to slow down, many folks suffer nagging backache—feel miserable. Minor bladder irritations due to cold or wrong diet may cause getting up nights or frequent passages.

Don't neglect your kidneys if these conditions bother you. Try Doan's Pills—a mild diuretic. Used successfully by millions for over 50 years. It's amazing how many times Doan's give happy relief from these discomforts—help the 15 miles of kidney tubes and filters flush out waste. Get Doan's Pills today!

## BE SATISFIED

In remodeling or repairing your home be sure to use reliable equipment and good materials. Patronize American Agriculturist advertisers and you will be satisfied.

## Quickly-Made Gifts

2271

226

2578

2594

No. 222. Good gifts for babies are the five cuddly little cotton-stuffed creatures included in this pattern. (The cat and the elephant are not illustrated.) Cut in one size, 6 to 8 inches tall.

No. 2271. School-going cotton or wool or party-time taffeta are all good choices for this shawl collared dirndl done with the weskit effect. Sizes 2-10. Size 4, 1½ yds. 35-in., or 1½ yds. 39-in.

No. 2578. There are so many ways to make this home frock: with cap or short sleeves, button or zipper front closing, a wide collar or a collarless neckline. Sizes 12-20, 36-44. Size 18, 4½ yds. 35-in.

No. 226. Bride's and bridesmaid's costumes for a little girl's favorite doll are fun and inexpensive to sew! Hats, dresses, undies, included. Please order

by size for 14, 16, 18, 20 and 22-in. dolls.

No. 2594. Two pert gift tea aprons plus potholders! One size. Bias apron, mitten holder, 1¼ yds. 35-in. Apron with flowerpot holder, 1¼ yds. 35-in., ¼ yd. contrast. Use scrap pieces for included appliques.

TO ORDER: Write name, address, pattern size and number clearly. Enclose 25 cents for each pattern wanted. Add 25 cents for our Fall-Winter Fashion Book which has attractive pattern designs for all ages, sizes and occasions. Send to AMERICAN AGRICULTURIST PATTERN SERVICE, Box 42, Station O, New York 11, N. Y.

— A.A. —

A nice book to own or to give as a gift is *American Agriculturist's* new cookbook, "A Treasury of Country Cookery." It contains a collection of our most popular recipes. Price, \$2.50. Order from American Agriculturist, Box 367, Ithaca, N. Y.

## TO MY LETTER-BOX

By Elaine V. Emans

So very utilitarian you are  
I take your daily services for granted,  
Though knowing you have offered me,  
from far  
And nearby, gifts as if you were enchanted  
And not an ordinary letter-box!  
True, there are times you bring me only chaff,  
And there are days your empty presence mocks  
Me with a kind of nothing-for-you laugh;  
But year in, year out, I have leaned and plucked  
Beauty from you, courage I needed so,  
And laughter, too, while faith was often tucked  
In some thin envelope; and well I know,  
Sure as tomorrows come, there will be new  
And untold riches in the depths of you!

## FOR CHRISTMAS ENTERTAINMENT

With Christmas only 7 weeks away, hundreds of groups in communities throughout the Northeast will be thinking of preparing a Christmas program. To them, we recommend CHRISTMAS ON THE FARM, a heartwarming and delightful one-act play on our American Agriculturist list. It is tops in Christmas entertainment.

The price is 35 cents a copy and, like all American Agriculturist plays, it is royalty free. To order it, write American Agriculturist Play Department, Box 367, Ithaca, N. Y., and enclose 35 cents for each copy wanted. Send cash, check, or money order. No stamps, please. For a complete list of American Agriculturist plays, add 3 cents.

# DIABETES *Can Be "Hidden"*

By KATHLEEN BERRESFORD

**L**AST week I was talking about diet to a very attractive woman in her sixties. I was interested when she told me she had always had wonderful health, so I asked her how she stayed so well and young-looking. She replied that as her father was a doctor, she had had regular physical examinations all her life. Of course we all know that's a good idea, but we don't always get around to it, do we?

In her case it paid off because her last check-up showed she had diabetes. And she hadn't even noticed a symptom. Her doctor gave her a diet and the diabetes was quickly brought under control. Today she feels just as healthy as ever.

Doctors tell us there are about a million such cases of "hidden" diabetes in the country. Diabetes is caused by not enough insulin being produced by a gland called the pancreas. In a normal person, insulin is supplied to take care of the "sugar" in the system. But when the sugar is not properly burned, serious trouble may start.

People of middle age and over get diabetes most often, women more often than men, and it is more likely to develop in overweight people. Statistics show that of 20 people with diabetes, over 40 years of age, 17 are overweight. Children with diabetes, on the other hand, are apt to be underweight. It is one of those diseases which often seems to "run in families."

Symptoms which you would notice are fatigue and loss of weight, being thirsty all the time, a big appetite, and

frequent urination. Even if you haven't noticed any of these, a yearly check puts you on the safe side.

When diabetes is detected in the early stage, diet alone is often sufficient to keep it under control. Or diet may be used along with injections of insulin. In these days a diabetic is fortunate because a new type of dietary management has just been worked out. For several years the American Diabetes Association, the American Dietetic Association, and the U. S. Public Health Service have been working together to plan a kind of diet which would be easy to prepare and give the patient almost as much variety and wide choice of food as he would have ordinarily.

A diet is planned individually for the patient by his physician or dietitian, to fit in with his usual food habits. Selections are made from food groups, with substitutes for food exchanges, in certain specified portions. In this way there's less limitation on certain foods, no more worry about the percentage of starch or sugar in vegetables and fruits. Spaghetti? Yes. Ice cream? Occasionally.

Human nature is funny about some things. I know people who are a little suspicious that they may have diabetes, but don't want the doctor to tell them so. How much better off they would be if they found out definitely before serious trouble started! Remember, the earlier diabetes is found, the easier it is to control, and the better chance you have of living a normal, useful, and happy life.

**KNITTED LACE DOILY**—The feeling of swirling leaves is delightful in the delicate design of this knitted lace doily, No. PK-5549.

**WORK APRONS**—A handy gift for the men of the family—big and little. Make them identical work aprons, Nos. E-2398 and E-2399, in green sailcloth with maroon binding. Plenty of pockets for holding tools.

**ORGANDY PLACE MATS**—What could be prettier than this charming place mat and napkin set, No. PC-6080, made in organdy, trimmed with a crocheted border?

**QUILTED SATIN SCUFFS**—and a case to keep them in, No. E-1783. A quick and easy-to-make gift with a luxurious look.

## TO ORDER LEAFLETS

Write to Needlework Dept., American Agriculturist, 10 North Cherry Street, Poughkeepsie, N. Y., and enclose 3 cents in coin for each pattern wanted. Please write name, address, and name and number of pattern plainly. Add 15 cents for copy of our Needlework Book, the best value on the market. It's filled with designs for gifts—and contains several free patterns.

## The Way to be Sure of Honest Value

**Look for the RED BALL Trade Mark**  
when you  
**Buy Weatherproof Footwear**

That familiar trade-mark identifies BALL-BAND Footwear and the stores that sell BALL-BAND. It stands for honest footwear value today—just as it has for more than fifty years. When you buy Weatherproofs with the Red Ball on the sole, you know that you are getting BALL-BAND Quality that means true economy and BALL-BAND Comfort that comes from correct fit and warm, dry feet.

Be sure to try the new *Liqua-Flex* footwear—another BALL-BAND Development, lightest weight and most flexible of all Weatherproofs.

**OBERLIN.** *Liqua-Flex* slide-fastened wedge gaiter for women. Also made in two heel heights.

**KNIT GAITER.** The original knit gaiter. For warmest possible cold weather combination, wear with BALL-BAND rubbers or arctics. Long-wearing, flexible.

**ARCTICS.** 4 and 5 buckle heights. Securely anchored buckles, sturdy soles, correct fit.

# The Bobby Baby

By GEORGE DUFF

(Reprinted from an old issue of the Dairymen's League News, courtesy of George C. Lee, Editor.)

"Time was when the little toy dog was new,  
And the soldier was passing fair,  
And that was the time when our Little Boy Blue  
Kissed them and put them there."

HE came to stay with us on a November day when the skies and the sad wind and the dun-colored landscape appeared to mourn in sympathy with a little child who had gone forward but ten months into the adventure called life and had touched the edge of disaster and tragedy. His coming was a whim of chance. His mother was threatened with blindness and must go to the hospital for a serious operation, and, through a mutual friend, arrangements had been made for my wife to take the care of the little one.

For some time we did not even know his last name. This, however, was of small consequence, for with the truly great more than a single name is superfluous. Sweden remembers but one Charles out of many, and the French only one Napoleon. Undoubtedly, there are in this wide world a great many little boys called Robert, but for us of the lonely farmhouse there will forever be but one Bobby baby.

There was a dramatic quality in the parting of babe and mother, impressing itself on one long out of knowledge of such human dramas, and bringing from the dead years the recollection of another parting that shall not be redeemed with a meeting this side of the rivers of Eternity. I recall the mother's gallantry; eager, tremulous, hesitating on the verge of a breakdown and yet keeping back the tears. There were brief instructions and directions. The Bobby baby, it appeared, drank milk. Also he ate a thin but pleasing porridge manufactured from breakfast food. He was accustomed to amuse himself, and slept much by night but very little in the daytime.

I am sure that the baby realized all was not well in his world. Released from a last close embrace, he sat upon the floor, crying a little but not much, as became a man-child and a scion of the conquering race, and thrashing the carpet bravely with his string of wooden beads. When he was left alone with us he accepted his new surroundings, adjusted himself in the manner of a free and reckless adventurer, whimpered not but scolded a little, drank his milk and ate his porridge.

In the evening when the chores were done I ventured to take him from the missus' arms and scrape an acquaintance. He looked searchingly into a time-lined and homely face, gripped with surprising strength his rose-leaf hand upon a gnarled and knotty forefinger, climbed to his feet on my lap to investigate my hair and glasses, and accepted me as a kindred spirit. I am sure that is not a whimsy. I am sure that the Bobby baby recognized in me a firing-line comrade, and when I looked into his eyes of the Nordic blue, held in unwavering, kindly, speculative gaze into my own, there passed between us as between knights of old the bond of True Companions.

It appeared, in later communions, that he knew much which was withheld from the understanding of grown-ups. He was obsessed with a spirit of active inquiry, climbing and jumping around almost every instant one held him in arms; but in the midst of some

promenade or monkey-like contortion he would pause to gaze up at me with a kindly, philosophic, speculative look, as an angel with all the accumulated wisdom of the ages might gaze upon a mortality-trammeled man. I was impressed by the absence of lines on his face. There was no mark of care, no crow-track of time upon his brow, but a clearness such as I am sure the Nazarene Carpenter wore, not babyish nor effeminate as we think of such qualities, but strong and splendid and ineffably sweet.

We argued occasionally, not in misunderstanding and with acrimony but even as two brotherly Scotch philosophers on a point of metaphysics. "A-ah, a-ah!" stated the Bobby baby. "A-ah, ah, ah, ah, ah!"

"No, not a-ah,ah, but ba,ba,ba. Ba, ba, black sheep!"

"A-ah,ah!" he persisted, frowning ever so slightly. "A-ah, ah, ah,ah,ah!"

There the matter rested, neither side being willing to give in one whit. On other subjects we also differed slightly; as, for instance, his idea that spectacles were out of place on the human countenance and should be seized forthwith and cast upon the ground. Further, he was averse to lying quietly in my arms as I rested on the couch, and must be held at arm's length above me while he investigated the mantel clock and the flower vase beside it. At times I was constrained to put him in his pen; that same being a cloth-lined dry-goods box in which he could stand erect by gripping the top and batter the side with his small but vastly enduring hips in a manner to frighten bystanders.

Sometimes, watching him at his labors or gazing into his wonderfully

unlined face, I drifted into curious speculation. Here was the philosophy of the English Schoolmaster reversed — the beginning of possibility instead of the end of earthly opportunity. Yonder small hands, now grasping ambidextrously the string of wood beads, why might they not tune the lyre of a new Milton or emphasize with strong gesture the defiance to tyranny of another Hampden?

Those little feet, kicking the sides of the box with absurdly diminutive shoes, what paths of splendid adventure might they not tread? The baby voice, now scolding in low monotone, now lifted in insistent proclamation of a-ah, ah; why might it not one day thunder in a battle shout of liberty or roll sonorously in defence of the Rights of Man. Cromwell was another such babe once, and Patrick Henry, and George Washington, and Lincoln of Illinois!

\* \* \* \* \*

But the hours of speculation, mild argument and joyous companionship, came at last to an end. It was a fair day when we took him to meet his parents, who lived away in the city. It was brighter than on the afternoon of his coming, yet somehow the lift of the clouds was not answered by a lift in an old fellow's heart, and a shadow was thrown across the sun's gallant track.

I knew, though, when a young man came running to eagerly gather the Bobby baby from my wife's arms that all was well with my little comrade, even if in days to come all would not be well at a lonely farmhouse in the hills. I knew that he had still a True Companion, fit to ride behind on a jack-horse to Banbury Cross, or to trudge beside in workaday marches when childhood's dreams grow dim. I am comforted, even though I may not see the Bobby baby again.

We feel, the good wife and I, a compensation in our experience, although it ended in sadness and loss. We have touched again on the tenderest, most unselfish, most splendid of human emotions, and come into closer harmony with all of the great and the good and the true who have loved little children. We understand better, now, Eugene Field, who sang of Little Boy Blue, and Abraham Lincoln, hailfellow of every

IT WAS with pleasure that I noticed a story by "George Duff" in your last issue. I always liked to read his stories in the "News" and I often recall with pleasure the day back in 1927, when I was selling subscriptions to American Agriculturist, that we spent together riding over the hills around Berkshire, calling on farmers, selling the paper and visiting.

It was a very satisfactory day, and then a short time later he wrote a story for the "News" entitled "The Salesman," giving by fact and fiction a summary of our day together. Throughout the summer whenever I could get a little time and make a route by his home, I would stop and sit a while on his front porch, swapping stories and listening to his philosophy. I am very happy to think I had the chance to know him personally.

I thank God that there are some things that neither time nor fire can destroy, among them the memory of those we have known, such as "George Duff" and my father and others who have passed on.—Arthur L. Cook, East Freetown, N. Y.

child, and Dr. Barnardo, who gathered thirty thousand waifs from the streets of London town, and yet another, Who said—

"Suffer the little children to come unto Me."

—A.A.—

## WRITING NEWS

ANYONE who has the responsibility for local publicity will find the following suggestions helpful and very much worthwhile. They were written by E. Payson Smith, Public Relations Director of the New York State Grange, and issued by the Grange for the benefit of its lecturers, publicity representatives, secretaries and masters. Here they are:

Your news story must contain the answers to the questions: What, Where, When, Why and Who, and in that order, preferably. Your editor wants to be able to quote local names, so you might put in your first paragraph: "... according to (chairman, master, lecturer, etc.)." Long lists of committees should go at the end, so they may be left out of necessary without spoiling the story.

Get names accurate and in full. Give at least a first name, not just initials.

Type your copy if at all possible. Double space whether you write or type, so that corrections can be easily made. Use only one side of the paper.

Get your copy in EARLY. This might well be the first rule, for it is useless to an editor or announcer if it is handed in too late. Find out when your local editor wants copy, and carefully observe his deadline.

Make a personal call on your local papers and radio stations when you can, and as often as you feel you are welcome. Give the editor all the news you can, whether about your Grange or not. He will appreciate personal items from time to time. Give your PHONE NUMBER so a reporter can get in touch with you. Your editor will appreciate your desire to help.

PHOTOGRAPHS are welcomed by some papers; others wish to take their own. If the latter is the case, notify the paper well in advance so a photographer can be assigned. Be sure the event is of sufficient importance to warrant a picture. Photos are expensive to publish, and your idea of importance may not be the same as the editor's. You have done your job when you notify him of the event.

If you submit pictures, be sure they are sharp and clear, with objects and people large enough to be seen. You may have to send in the negative, so that it may be enlarged. Do not have objects or people in stiff, formal poses.

### SLIM & SPUD

## League Women Stress Challenges

**I**F YOU are planting for one year, plant grain; if for 10 years, plant trees; if for 100 years, plant men. We need to plant for real men and women who can meet the challenges of today," said Mrs. Elizabeth Roe-Cloud, the 1950 American Mother who was the featured speaker on the program of Dairymen's League Women at their 24th annual meeting, held in Syracuse. "A peaceful world," she declared, "depends entirely upon the love, the hope and dreams of our American homes. What happens there is basic to the kind of community, state, nation, and world in which we live. We need to remind ourselves of our heritage. We must again become a spiritual democratic nation, and our children must appreciate their heritage."

### Of Service To All

The necessity of emphasizing spiritual values was also stressed by Mrs. Vera McCrea Searles, founder of the League's Home Department and its former supervisor. "We have to be bigger today than we ever were before," she said. "The United Nations has united the countries of the globe in a great world organization. Whether we like it or whether we don't, we are launched on a great world program. We have to raise our eyes to a new level and a new goal. We must turn to the spiritual ideal of things. I am of the conviction that until nations recognize God as the only power, and we begin to introduce into our political life the same ideals and to be of service to all, we will not have peace."

League women's activities and accomplishments during the past year were reviewed by several delegates and committee women. Mrs. Carl Greene, Oneonta, N. Y., member of the Susquehanna Valley Local reported on ways in which the Susquehanna unit is training its young people to take part in meetings and to assume responsibility. Mrs. Lloyd W. Peavey, Warwick, N. Y., told of the work of New York Women's Legislative Forum. Civil Defense legislation, she said, was of prime interest to the Forum in the last session of the Legislature; oleo legislation was the most debated, with interest high also in rent control, education, and permanent registration.

Mrs. Daniel G. Buffum of Little Valley, N. Y., President of the New York State Council of Rural Women, reported on the work of the Council and pointed out that it is a "united family working together," composed of three groups—Home Bureau, Grange, and Dairymen's League women.

### Family Program for '52

League women's "family program for 1952" was outlined by Mrs. Clifford T. Brush of Milford, New Jersey, as adopted by League Home Service leaders and advisory and legislative committee women. The program called for: (1) Strengthening community relationships; (2) Stressing interdependence of producer and consumer; (3) Arousing the public to the importance of milk; and (4) Stimulating and encouraging Dairymen's League Young Cooperators to find their place in the cooperative and to assume their responsibilities.

Mrs. Wilbur Steiner of Akron, N. Y., presented resolutions for '52, and Mr. S. R. (Steve) Farley of the League's membership department reported on how the Blue Cross plan has worked out during 1951 for League members. Some members, he said, have been saved as much as \$500 in hospital bills as a result of the plan.

Miss Genevieve A. Judy, Supervisor of the League Home Department, was in charge of the program.

## AT HAYFIELDS

By TOM MILLIMAN

### Milkhouse Plans Halted

TWO months ago, brief reference was made on this page to plans for building a milkhouse at a more convenient location, of a design to fit the modern side-opening coolers. Last May a narrow 8-can side opener was purchased. The intention was to get rid of our 15-year-old wide 10-can top opener and replace with a narrower 12-can side opener to go with the 8-can job.

All plans are now halted pending the outcome of investigations into the bulk handling of milk in which the traditional 40-quart cans are eliminated. Investigations are being carried on independently by the cooperative through which our milk is pooled and by the milk retailing company in Rochester to which a contract hauler trucks the milk in cans every morning.

### Cold Wall Tank

*The key to the bulk handling of milk is at the farm end. It consists of a single tank with cold walls into which milk is poured as it is carried from the cows morning and night. A slow moving agitator is incorporated in the tank and is operated in the morning to provide thorough mixing to insure a fair sample for butterfat and bacteria count.*

A second and less revolutionary step is a conventional milk tank truck which backs up to or drives alongside the milkhouse and quickly pumps the contents of the farmer's tank into the truck tank. Pumping out the farmer's tank does not, however, begin until the truck driver, who must be a licensed weigher and sampler, has lowered the gauge into the farmer's tank to determine quantity of milk, and has drawn representative samples, one of which he leaves with the farmer if the latter desires it.

The pump and hose carried by the truck are highly sanitary pieces of equipment for which special provision is made for protection from contamination while the truck is in motion. Power for the pump on the truck is provided by an electric cord carried on the truck and inserted into an electric socket at the door or on the outside wall of the farmer's milkhouse.

### Advantages

In Connecticut, the above too briefly described system, with variations, has been in operation in one area for about three years. It seems to be successful and is being expanded.

In New Jersey a small milk company operating in a suburban area of Camden and Philadelphia started April 1st of this year, and now takes bulk milk from cold wall tanks on 16 farms. A single tank truck does the hauling. The individual farm volume as reported on May 2, 1951, ranged from 331 lbs. at the low farm to 1152 lbs. at the high farm. The average quantity for 16 stops was a little less than 800 lbs.

Dairymen and dealers find themselves in agreement that butterfat test runs higher by the bulk method. The gain is estimated to be not less than one point or 1/10th of 1% higher. Well—that is 7 or 8 cents a hundred. If it is two points, as some claim, then the gain is 15 cents, and more in some

areas.

One New Jersey farmer said, "We don't have to stand and wait for the cans to fill up. This method uses a smaller milkhouse." Another said, "I like the quick cooling. You don't have to wonder about running cans over, especially if someone is helping or if someone is talking to you." A third farmer said, "There are no heavy cans to handle. It is just a better cooling system. You don't have to cool cans to start cooling the milk. It is slower cooling with cans." And a fourth farmer said, "This is the first break for the farmer. The milk is bought in the milkhouse. When the milk goes out of the door it belongs to the buyer, and I know exactly what I'm getting paid for."

*Milk retailers and dairymen agree that the bulk tank system provides the consumer with cleaner, fresher tasting milk with lower bacteria count.*

### Disadvantages

Some claim there are many handicaps and go so far as to state that the disadvantages outweigh the gains. One of the objections has to do with the large investment in the tank truck as compared to most trucks now hauling milk in cans. The driver must be doubly licensed and should be good enough to be trusted as an official weigher and sampler. Presumably such a man would be paid more than a regular truck driver.

While experience would point to a fairly low cost for actual trucking from farm to plant, some claim that tank hauling over the long run will be higher and this question remains unsettled. The reports from California show that tank truck hauling is cheaper to the dairyman. However, dairies run large in that state and truck stops are fewer.

Another sobering thought is the claim by skeptics that the tank will daily require a lot of special cleaning on the part of the farmer. This objective seems, however, to be fairly well dissipated in the experience of Connecticut and New Jersey.

Still another objective has to do with the cost to the farmer of the cold wall

tank and accessories. But here again the problem must be viewed in relation to the investment farmers now have in conventional coolers, milk cans and milkhouse, and should be examined also in the light of a little higher test and a little greater weight, the latter coming from disappearance of spillage and avoidance of loss of weight by cream adhering to the shoulders, necks, and lids of milk cans.

Fortunately California is acting as one of the experimental grounds in working bugs out of the system. Certainly it has already been shown in New Jersey that bulk handling need not be restricted to large dairies, when it is noted that four dairymen out of 16 had only 400 lbs. or less.

### The Prospects

The system is being studied and refined right along. Whether it will be extended into other areas by the spring of 1952 remains open. In any case the launching of a program like this takes a lot of doing all along the line, including the milk plant, and must necessarily be slow. Material for construction of the equipment may become the bottleneck when all else is in the clear. It is something to be watched and studied with an open mind.

Meanwhile, Hayfields will struggle along with the old milkhouse, at least for a few months. If bulk milk handling becomes available next spring there will still be a chance to refuse it, or take it. But if we go ahead and build a conventional milkhouse now and later decide for the bulk tank, should it become available, we are sure to discover that more money was spent on the milkhouse than was necessary and the structure will be of the wrong design.

Another angle is lurking in the background, out of sight, but not very far over the hill. If the bulk tank milk handling at the farm proves to be sound, then why isn't the prospect of pumping milk through malleable glass pipes directly from the cow to the bulk tank equally practical? The idea would be to pump the milk from the cow as she stands in her own regular stallion. Milk is being pumped that far in one cow establishment for sure, and perhaps in others. It is no pipe dream, not even a glass pipe dream.

*In writing this article the purpose is not to endorse the method as it stands today, nor to predict where it will be years hence, but rather to stimulate thought, discussion, and even argument. It is meant to be provocative, and should be followed by through-going descriptions from engineers and technical men.*

### "SHOOT FOR 120 ON 26"

THE above heading appeared February 3, 1951, and had to do with the description of two built up sod fields of 10 and 16 acres and the goal set for them of 120 bu. of dry shelled corn to the acre. The story said, "A report will

be made."

Robert Burns, the immortal bard of Scotland, had it about right when he said, "The best laid plans o' mice and men gang aft a-gley."

Within a month after announcing the goal for these fields on Hayfields proper, the owner of a 100-acre farm we had been renting from year to year unexpectedly gave notice that he would take over. This left us short some 60 acres of grass-legume hayfields and dry stock pastures. A rundown 120-acre farm was quickly rented for 10 years, but it had only 5 acres of poor hay and no pasture.

### A Squeeze

As spring came on, with 108 head of cattle on hand and 123 acres of sod to furnish pasture, silage and hay for one year, the outlook was tight. It all came through in grand style except 10 acres of Sudan grass. In order to save time we had damaged the Sudan by sowing the fertilizer with the seed.

As to the 120 bu. corn fields, the smaller one of 10 acres wasn't even plowed. Bred heifers and dry cows took it over as their main pasture, along with three acres of hillside, and the record runs considerably higher than two head to the acre.

On the 16-acre field, a tall growing hybrid corn was planted thickly for silage. The need for hay and pasture was so great and the acreage so limited that in June we dared fill only two of three silos with grass. The silage cornfield had enough crop, well eared too, to make a yield surely on the topside of 18 tons. See picture.

### Colleges Were Followed

For a quarter century the findings of Cornell, Penn State and Rutgers have been heeded and followed, and three successive county agents have helped. Sometimes it was hard to find the money to keep up with recommended practices. With the land now in condition to absorb moisture, withstand dry spells and yield handsomely, a vote of thanks is due the institutions mentioned, the AMERICAN AGRICULTURIST and national farm papers, and to other farmers.

### CHAFF

Inflation, taxes, and threat of war tend to heighten appreciation of the common good things all around us. Never in forty years have McIntosh apples had such a glorious taste as in this October. The hot spell early in the month ripened up the "Macs" to a point of high flavor and stopped in time to leave a snap in every bite, and plenty of juice.

On a farm where the home orchard has long since disappeared, an even greater pleasure than eating prime McIntosh can be had from watching children chomp them down as they help themselves from a newly arrived basket. World's champion eater, weight for age, is a small boy putting away fruit he especially likes.

Perhaps the best way for keeping a bull fertile is to winter him outdoors with an open shed for shelter and acres of ground to roam around on. The sweepings from cow mangers, a little good hay, plus whole oats or fitting ration, seem to do nicely.

A boy brought up on a farm where hens ran around loose ate plenty of eggs with dark colored yolks. In fact he knew no other. Then if he moved to the city, one of the many adjustments he had to make was learning to like eggs with pale yolks. Those are store eggs and come from cooped up hens, four square feet to a hen. Still later, if he is lucky enough to return to a farm for part or full time, he has to learn all over again to eat eggs with deep orange colored yolks. The readjustment is not easy, but can be helped if one remembers that such eggs are vitamin enriched from the garden, the fields, and the barnyard too!

Snapshot taken on October 6, a dark, drizzly day. Here on the 16-acre field the corn is still untouched by frost, while on the rented farm only 20 feet lower and 3/4 mile away, frost had nipped and whitened the tops and leaves of grain corn. The hybrid shown is Ohio K-24. Although thickly planted, it is well eared. This is an open formula corn, the parentage of which is controlled by Ohio State University. See "Shoot for 120 on 26."

### PROTECT YOUR PROPERTY

I have been having considerable trouble with hunters and fishers. They do a lot of damage and ignore me when I order them off my property. What can I do? I live in New York State.

WHEREAS we realize the New York State law relative to trespassing for the purpose of hunting and fishing is not perfect, it is a lot stiffer than in many other states. This is because it makes it a crime to go on legally posted property to hunt and fish. Trespassers do not have to do any damage or catch any game or fish. The fact that they are there with a rod or gun shows they are disobeying the law.

Some readers claim the law is ignored. In that respect, we would like to know of any case where the law has been broken, where the trespassers are identified and reported to the game protectors, police or other law enforcing agencies, and where no further action is taken. It is, of course, very important to furnish proper identification. If you take a car license number, be sure it is correct; and the same applies to a hunting and fishing license number.

In areas where the posting law is flouted by sportsmen, we have found that a successful prosecution and fine do more than anything else to increase respect for the law.

### Post Legally

You must have your place legally posted. It has been our observation that many places are not posted with the proper sized signs. You can post at any time, but illegible or destroyed signs must be replaced once a year. The law says this must be done during March, July, August or September.

The New York State law also provides that signs must be not less than 11" square and must be placed along the entire boundary of your land, including a sign at each corner, at distances of 40 rods apart or less. Printing, exclusive of name and address, must cover at least 80 square inches. Signs must contain the name and address of the owner or tenant of the land. The entire property must be posted; and when a public road goes through a property, you must also post along each side of the road.

If any reader wishes information on posting in some other state, write AMERICAN AGRICULTURIST, Service Bureau, Box 367, Ithaca, N. Y.

A good proportion of hunters and fishers are real sportsmen; and many farmers (even though they have their land posted) will grant permission to hunt or fish to anyone who makes a courteous request to do so. Farmers who post their lands usually do so with the idea of keeping out careless and destructive "sportsmen."

— A. A. —

### RETURN UNWANTED POLICIES

Recently I received through the mail a renewal car insurance policy which I had not ordered. Since I had taken out insurance with another company, I didn't want it. Now the company is trying to collect the premium because I didn't return the policy.

We have it on good authority that the insurance company could probably collect if this ever came to court. It is our understanding that an insurance policy is in effect as soon as it is mailed. So that they have coverage at all times, most people rely on their insurance agents to issue renewal policies when the old ones expire.

If you get a renewal policy through the mail and do not want it, it is very important that you return it immediately with instructions to cancel it.

## COLD DOESN'T STOP a COMFORT COVER owner

### Thousands of EASTERN Farmers Have COMFORT-IZED Their Tractors

Let winter winds howl! You'll keep warm while you work—with a genuine COMFORT Heater. You can save working days you ordinarily would lose due to the cold—protect your health by keeping warm. Make YOUR tractor a year-round tool with a genuine COMFORT Heater—the famous heater more farmers buy than any other make!

### WARNING—INSIST ON COMFORT

Compare Fit! Compare Quality! Compare Price!

COMFORT Heaters are custom-made to each model farm tractor. When you insist on the genuine COMFORT Heater—you are sure of correct fit and better heating. Attaches securely to tractor in a jiffy—no flapping or sagging. Converts to low-cost heated cab if desired. See Your Dealer or Write For Details.

## Room for your Farm Machinery in Economical, Permanent Timberib Sheds

Here's the shed that gives you everything you want for storing your farm implements—trim appearance, low cost, practically no upkeep, and not a single post to get in the way.

### Pre-Cut and Pre-Fitted

Sides and roof of your shed are formed by arched Timberib rafters which combine stud and rafter in 1 continuous piece. Timberib Rafters come to you completely pre-fabricated. They eliminate all cutting, fitting, and require no plates, cross bracing or ridge pole. With construction thus simplified, you can erect your Timberib shed in a few hours even with inexperienced help. Complete erection directions are included with each set of rafters.

Your Timberib shed may be up to

75 feet in width, and as long as you want. It is readily adaptable for other farm uses such as grain storage, loafing sheds, utility buildings.

For complete information on Timberib buildings, fill in and mail the coupon below.

**HERE IT IS ...**  
**the inside story**

*of the NEW and far*  
*more powerful* **FERGUSON "30"**

Look *inside*, where engineering really counts, and you'll see why the *new* Ferguson "30"—with its host of engineering advancements and its one and only Ferguson System—is the greatest performer the tractor industry ever produced.

Beneath the sleek hood of the Ferguson "30" is a mighty valve-in-head engine designed to produce over twenty per cent more power than any previous Ferguson engine. It does far more work on each gallon of fuel. It runs far longer and far more efficiently between overhauls.

No other tractor ever produced has a better *torque\** characteristic (what you call *lugging power*). Where other tractors falter or stall, or are forced to a lower gear, the Ferguson "30" pulls right on through . . . to give you greater operating convenience, faster work, savings in fuel and engine wear.

New positive rotating valve assemblies keep exhaust valves free from sticking and burning. New, big, rugged gearing provides greater durability and longer rear-end life. A new air-fuel system provides a cleaner, cooler fuel mixture that results in longer engine life and more work from fuel. A greatly improved hydraulic system gives more positive action.

You'll like the *new* Ferguson "30". Why not telephone your nearest Ferguson dealer today?

**\*TORQUE EXPLAINED**

FREE. If you operate farm tractors, write for a copy of "The Axe and the Wrench", a simple explanation of the meaning and importance of torque in farm tractor performance.

Your nearest Ferguson Dealer is ready to arrange *your* Showdown Demonstration of the new Ferguson "30". If you cannot locate him, write us at the address below for the name and address of the Ferguson Dealer nearest you. At the same time, ask us to send you a free copy of the new full-color folder which illustrates and describes the many important features of the new Ferguson "30".

Brookfield, N. Y., Central School's homemaking award winner is Gwendolyn Pierson (above left).

Southington, Connecticut, High School chose Alexander Dyndiuk, Jr., as its most outstanding student in vocational agriculture.

Stanley Lisieski, Jr.

Anna Hazenfelt

"The American Agriculturist achievement award," says Stanley Lisieski, Jr., Goshen, N. Y., Central School's winner, "helps us to strive for a goal." In addition to outstanding work in farm projects, Stanley has been a leader in FFA, 4-H, camera club, intramural sports, dramatics, and bowling team.

Anna Hazenfelt, Middleport, N. Y., winner of the homemaking Achievement Award in Royulton-Hartland Central School, is enthusiastic about vocational homemaking and says that it has taught her to solve problems which she will have in her own home in the future.

Raymond F. Stephens, Constableville, N. Y., Central School's winner, says that our AA Achievement Award is an incentive to better work and study. In the picture is a 2-year-old Holstein heifer which he raised as a home project.

What It  
TAKES!*

American Agriculturist Foundation Honors 393 High School Students in Vocational Agriculture and Homemaking

THE YOUNG people whose pictures are on this page are just a few of the boys and girls in vocational agriculture and homemaking courses in high schools in nine northeastern states who were singled out by their school principals and teachers to receive the American Agriculturist Foundation Achievement Award.

Some awards are easily won, but not this one. It takes outstanding work in either vocational agriculture or homemaking; practical application of knowledge gained; good all-around school work; the ability to get along with others and to carry responsibility; skill, good management, leadership, and good citizenship. The award is given annually to two students in each Northeast high school participating in the project—to one Vo-ag student and one homemaking student.

Since 1945, when the award was first offered by the American Agriculturist Foundation, 3369 boys and girls have won it. Many winners have since gone on to fulfill the promise of their high school days and are doing outstanding work in colleges or elsewhere.

Listed on page 18 are the names of all 1951 winners reported to us so far. We only wish we could print some of the inspiring letters and reports we have received, with details of their accomplishments. What they have done and are doing indicates that these young people are building a firm foundation for their future and for the future of their country. Best of all, close behind them are thousands of other capable and outstanding boys and girls. We know this because many schools tell us that they find it hard to choose a winner. One school, Adams Center, N. Y., Central School, had to solve its problem in the case of the homemaking award by presenting it to two girls—Jean Spink and Esther Van Epps, who were equally outstanding.

The Achievement Award will again be offered by the American Agriculturist Foundation for the coming year to all high schools in the Northeast having (Continued on Page 18)

Maynard Armison

Mary Alice All

The record of the accomplishments of Maynard Armison, Batavia, N. Y., the Elba Central School winner, fills two pages. Maynard hopes to become a farm partner and then a farm owner.

"A student who has shown outstanding ability in the execution of her homemaking projects," said Mary Alice All's teacher, who selected her as West Canada Valley, N. Y., Central School's winner.

Faith Brooks

Charles E. Pierce

Faith Brooks of Farmington, New Hampshire, the Farmington High School winner, says: No matter where my future takes me, the practical knowledge gained in the homemaking courses will be invaluable.

Charles E. Pierce of Alfred Station, N. Y., Alfred-Almond Central School's vocational agriculture winner, is interested in raising Aberdeen Angus cattle and believes that there is a bright future ahead in agriculture for those who prepare for it.

Barbara Jean Ames, Cicero, N. Y. Barbara is wearing an outfit which she made herself, and is holding a bathmat she made, which was exhibited at a homemaking teachers' convention at Syracuse University.

# DRIFTED DRIVEWAYS ...MUDDY LANES...

**T**HE best answer yet to winter driving on northeast farms is this tread—the Unico Extra-Traction. It has plenty of pull both backward and forward. The long buttons dig in and bite, not only on unplowed roads, but in muddy lanes, rutted driveways, and slushy yards.

These tires are built for just such conditions. The lock-grip buttons are long and deep to give a positive hold on a loose or sloppy surface. The grip along the side takes hold of ruts. They don't get clogged up easily with mud or snow. Yet they run smoothly on dry roads.

Many farmers get through the winter without ever once putting on chains.

Cooperative G.L.F. Exchange, Inc., Ithaca, New York.

**HERE'S THE ANSWER**

## UNICO EXTRA-TRACTION TIRES

No. 3:

## What Can I Do?

By E. R. EASTMAN

(The suggestions in this series of short articles are for the purpose of helping both individuals and their organizations to take a more active part in good government and other citizenship activities.)

**F**ARMERS are the most misunderstood class of people in America today. Their public relations are at an all-time low. Vastly in the minority, farmers are blamed for the high cost of food and even for inflation. My city friends look at me reproachfully when they talk about the high cost of meat.

### Misinformation Confuses

Farmers and their organizations are largely to blame for this situation, because so little has been done to give the facts about the production of food and fibre to the consumer.

You can do something about this problem.

You can write frequent letters to your city friends and relatives. You can write to your representative in Congress. Best of all, you can get your farm organizations to discuss the matter in their programs, pass resolutions, and then send the facts to newspapers, to city politicians, and labor leaders, and to representatives in Congress.

No wonder the city consumer is confused. Most of the information he gets about food production is misleading. For example, a big magazine recently had the picture of a pretty farm girl on the cover. Inside was an article stating that this girl had 15 or 20 pairs of shoes, a dozen or more hats, a closet full of beautiful dresses. The idea left by the article was that this rich girl was typical of all farm girls. The truth, of course, is that she was typical of practically no farm girl. But every time anything is written about

farming in magazines or newspapers, some rare example is picked out of a farmer who has made a lot of money.

What are the facts, you ask? Here are a few that you can use. (I am indebted for most of these facts to Professor R. F. Fricke of Cornell University).

1. Taking 100 as the index of prices in 1914, New York farm prices in the middle of 1951 had advanced to 255, or a little over 2½ times.

But prices of articles farmers buy had advanced to 282, and costs of dairy farming had advanced to 337.

The cost of living in the United States had advanced only to 262, while earnings of factory workers had advanced to 566, or over 5½ times.

2. Farm people earned 69c per hour in 1950, as compared with \$1.46 for

The history of liberty is the history of limitations of governmental power, not the increase of it.  
—Woodrow Wilson

factory workers and \$2.03 an hour for building construction workers. Hourly earnings of farm people went down from 93c in 1947 to the 69c in 1950, but hourly earnings of factory workers jumped from \$1.25 in 1947 to \$1.46 in 1950.

In addition to farmers' relatively low wage, they only received 5% interest on their investment in plant and equipment, nothing for management.

### Farm Income Down

From 1947 to 1950, farmers' income fell 27%, while during the same period the national income rose 16%. The total farm income dropped from 17.8 billion dollars in 1947 to 13 billion in

1950, while the national income rose from 199 billion to 236 billion in the same period.

Per capita farm income dropped from \$992 a year in 1947 to \$804 in 1950, while non-farm per capita income rose from \$1,383 to \$1,546.

Some of your well-informed city friends will come back with the statement that farm income for 1951 is somewhat higher again. That is true, but farmers' costs are also much higher.

In spite of all of the yelling you hear from city people about the cost of living, it is true that an hour's earnings of the factory worker will buy on the average more food in 1951 than at any other time in our history.

The only individual food items this does not apply to are certain meats, cheese, margarine and canned tomatoes. The consumer can now buy with an hour's earnings more bread, milk, butter, bacon, eggs, oranges and potatoes than ever before.

### The Other Side

It should be noted in arguing with the consumer that we are talking about the earnings of factory workers. People living on pensions or on lifetime savings or on salaries that have not kept up with inflation are of course hard hit by food prices. But the facts certainly prove that the farmer is not to blame for the high costs of living.

Nowhere else in the world is it possible for a worker to buy so much food or live so well on so small a part of his earnings. Nowhere else in the world is food produced in such quantities and so efficiently as it is by our own American farmers. If farm people received the same return per hour as the city worker, and the same return on capital as manufacturing corporations, the price of food would have been doubled.

If you want to help your farm business, and if you want to do your part toward being a good citizen, help AMERICAN AGRICULTURIST, the colleges of agriculture, and your farm organizations to get this information to the consumer. What can you do? You can do a lot if you will.

## BETTER BUY- Write Now

... because *right now* is the time to order your new silo for use *this coming season*. As an early buyer, take advantage of seasonal discounts — better service.

Craine tile stave silos — and the rest of the Craine line — are top priority investments for farmers everywhere ... investments in profitable feeding. They're profitable, not expensive — and *now* is the time to insure your future profits.

Be ready for whatever the uncertain years ahead may bring. Mail this coupon, *right now*.

## NEW YORK YOUTHS WIN LADD SCHOLARSHIPS

INNERS of Carl E. Ladd Memorial Scholarships for the current year have been announced by the College of Agriculture at Cornell University. Named in honor of Dr. Carl E. Ladd, former Dean of the College, the awards, valued at \$200 each, were made on the basis of attainments in scholarship, character, and leadership. Shown above are (left to right): Dale Winters, North Bangor; Daniel Basset, Inter-

laken; June Gibson, Stanley; Donald Cario, Hamlin; Theodore Mullen, Stafford; Paul Dries, Pavilion; Susan Heagle, Johnstown; John Price, Livonia; Kenneth Olcott, Fabius; Lawrence Sherman, Westport; and William Kelley, Camden. Not shown are: Charles Caton, Oakfield; Robert Grossman, Burlington Flats; Roger Harrison, Barker; Clayton Hotchkiss, Wiscoy; and Robert Willis, Cooperstown.

Freshening time brings extra strains that call for peak condition of digestive and generative functions. Adding Kow-Kare to the feed is such a low-cost "ounce of prevention." Its Iron, Iodine, Tonic Drugs, Cobalt, Calcium, Phosphorous and Vitamin D promote extra vigor, help prepare the cow for another cycle of full milk production through effective conversion of rich feeds. Three sizes, all stores.

## TO PREVENT COLDS

**A**BOUT every third person I know is either having some form of a cold now or has had one in recent weeks. And so it will go all winter. When our children were young and one of them came down with a cold, it was almost a sure thing that all the others would get it.

With all of the progress that has been made in medicine, practically none has been made in either preventing or curing the common cold, which is responsible for more illness and half-illness than any other disease. It would seem that the doctors and scientists could do more about it than they do.

There are a few basic principles that will help prevent a cold and help you to recover from it quickly if you do get one. The first is a well balanced diet, with care not to overeat or indulge in any one food. Did you ever notice how a wave of colds will almost surely follow the heavy overeating of the Thanksgiving and Christmas holidays? The diet emphasized by the late Ed Babcock will do more to preserve your general health and prevent colds than almost any other thing that you can do. In brief, that diet is based on milk, eggs and meat, supplemented by a wide variety of fruits and vegetables.

The second essential for the prevention of colds and many other diseases is plenty of rest, particularly for those who are middle-aged or older. An overtired body is an invitation to infectious diseases.

When you once get a cold, the quickest way to get rid of it is to go to bed, or at least to stop work and keep away from other people. This precaution should have more attention than it does, if only in fairness to others.

The third cold preventative is to keep away from those who have one. A doctor once told me that one of the surest ways to prevent catching cold or some other infectious disease was to wash your hands thoroughly with soap several times a day. Dishes used by anyone with a bad cold should be boiled.

It ought not to be necessary to add that every sneeze should be covered, and the used paper handkerchiefs burned.

## "FAR FROM THE MADDING CROWD"

**A**S YOU KNOW the editorial offices of AMERICAN AGRICULTURIST are located in the Savings Bank Building in Ithaca, N. Y., and our big printing plant is in Poughkeepsie, N. Y. Last week I flew from Ithaca to New York, and the next morning took a train out of the Grand Central Station to Poughkeepsie to spend a day in our plant.

For nearly a hundred years before AMERICAN AGRICULTURIST moved to Ithaca in 1934, its headquarters were in New York City. For many years when I first began working for the A.A., I lived in Yonkers, and commuted every day by train back and forth between Yonkers and our New York City office. Like millions of other commuters, for years I got up in the morning, grabbed a hasty breakfast, ran to the train, read the morning paper going into the city, and then ran from the station to the office, at night repeating the process in reverse.

Literally millions of people rush into New York City to work every morning and rush out again at night. They go on subways, hundreds of commuter trains, and in addition to the regular traffic their cars crowd the roads coming into the city almost bumper to bumper. As I stood on the stairs in the Grand Central Station overlooking the racing

By E. R. Eastman

crowd, all I could think of was the running hither and thither of the ants when as a boy going after the cows I kicked off the top of an anthill.

As the poet said, it is indeed a "madding crowd," and an unnatural way in which to live. In the large cities one seldom sees a sunrise or a sunset. He is hardly conscious of the changing seasons, the glorious colors of the autumn, and the hope and inspiration that come with spring in the country. It's bad for the people and for the nation to live that way, bad when we change, as we have in America, from a great rural country to one where a large majority of the people live in the crowded centers of population.

One possible answer to the problem is continued decentralization, with people living in the country and working in the city. This is quite possible with modern rapid transportation, but it still presents the problem of getting back and forth to work.

As I stood there waiting for the train to Poughkeepsie and thinking about these things, I was thankful that I was no longer spending so much of every day of my life running for and riding on trains. As I watched the strained faces of the hurrying throngs, I was thankful, also, that I had gotten away from them and gone back to my farm home to live as I had when growing up. To spend a few days on a business trip or for recreation in New York or any other large city is interesting, but not all the money in the world could hire me to return there to live permanently.

## POULTRY IS BIG BUSINESS

**E**VEN poultrymen themselves do not realize the tremendous growth of their industry in a comparatively short time. When I was a boy, I hated hens. They produced a few eggs in the spring, and some of these were lost because the hens stole their nests and the eggs were no good when they were found. The henhouses were lousy—how I hated to go in them in the summer!—and cold and draughty in the winter.

Then along came pioneers like Jimmy Rice and many other leaders and scientists, and the industry began to grow by leaps and bounds. Today poultry is the third farm enterprise in the United States, accounting for about 10% of the farm income. Dairying accounts for about 13%, and meat animals hold first place with nearly 33% of the U. S. farm income.

In the Northeast, dairying is of course our first farm enterprise, bringing in about 50% of the farm income. Poultry is second, and in the New England States poultry is a close second to dairying. In New Hampshire, Massachusetts and Connecticut it outranks even dairying. In Maine, potatoes are first and poultry second, and poultry is second in point of income in Rhode Island.

## BIG TREES

"I have a new idea for a contest that should be of interest to the readers of AMERICAN AGRICULTURIST. It concerns trees. Everybody likes them. What and where is the largest deciduous tree in AMERICAN AGRICULTURIST territory (Pennsylvania, the New England states, New York, New Jersey, Delaware and Maryland)?"—R. W. S., New York

**F**OR the purpose of this little contest, we will say that the dimension of the tree to be considered will be the circumference near the base. If you know of an unusually large tree in your section, measure it, get a first class, sharp picture taken, and send it in to AMERICAN AGRICULTURIST. We cannot promise to use all the pictures we receive, but for every one we can use of either evergreen or deciduous species we will pay \$5, and we will return

the other pictures at the end of the contest. Send letters and pictures to AMERICAN AGRICULTURIST, Department LT, Savings Bank Building, Ithaca, New York, before January 1, 1952. If more than one person sends in a picture of the same tree, the earlier postmark date will determine the winner.

## HOMEMAKERS ARE NOT LAZY

**I** HAVE just read a magazine article written by a building engineer, the title of which is "Your Wife Has a Racket."

The gist of the article says that women now, with modern labor-saving machines of all kinds, have a very easy time of it. are lazy, and furthermore that they could take it easier still if they would use a little engineering skill in organizing their work better.

Well, that article made me mad. I am thankful that because of modern appliances women now do not have to slave as hard as my Mother did when she made the butter from a large dairy, did other farm work, cooked and made most of the clothing for her husband and four of us boys, and did all of those jobs with no modern conveniences whatever. But it is a lie and a slander to say that the average homemaker, particularly the farm wife and mother, is lazy, that her work is poorly organized, and that really she has little to do.

It has always been a marvel to me how a mother with two or three young children can do as good a job as she does of raising those children, preparing well-balanced meals, and making the home beautiful. To be sure, there are exceptions, and certainly every woman, like every man in his business, could probably do a better job of organizing the details. But if modern gadgets have given the homemaker a little more time for her children, for some part in civic duties, and for recreation, thank God for them!

## THEY MUST HAVE MORE STEEL

**T**HE amount of steel allotted by the government for the manufacture of farm machinery was reduced from 673,000 tons in the third quarter of 1951 to 578,000 tons in the fourth quarter, a large and dangerous reduction.

At the same time, another department of government, the U. S. Department of Agriculture, is urging on farmers the necessity of greatly increasing production for next year.

These two government policies conflict, for it is obvious that farmers cannot increase or even maintain their present production without an adequate supply of farm machinery. And the equipment manufacturers cannot make that machinery without steel.

There is always something that a citizen can do about problems like this. Let your representative in Congress know about your wishes in the matter. If your representative doesn't hear from his constituents, how else is he to know the real "back home" situation and to vote in your interests?

## EASTMAN'S CHESTNUT

**O**NE of the many nice qualities of the Scottish people is their grand sense of humor, and no one loves a joke on himself better than a Scotsman. In fact, the Scots themselves are responsible for spreading most of the chestnuts about their closeness with money. One of my friends sends me this one:

"It has been said that the first Scotsman to use free air at a service station blew out four tires."

And Mrs. McBride of Brockport, New York, tells the story of a Scottish soldier, badly wounded, who requested an Army chaplain to write a letter for him to his wife. Anxious to oblige, the chaplain started off with "My dear wife:—"

"Na, na," exclaimed the Scot. "Dinna pit that doon! Ma wife canna see a joke."

# AA's Farmers' Dollar Guide

**LOOKING AHEAD:** In the months ahead it looks like good business to reduce debts and get in a position to weather a storm if it should come. We also suggest that you take sure profits rather than speculate for big stakes, that you cull hens and cows carefully, plan to fertilize crops heavily and to grow better roughage in 1952.

**NEXT YEAR:** Government prediction for 1952 farming includes prices and net income about same as '51; expenses higher; a new total production record, weather permitting; some shortages in supplies for production. Net 1952 farm income forecast at \$15 billion, lowest (with exception of 1949 and 1950) since 1941. Non-agricultural dollar income has increased each year since 1938 and is expected to be higher in '52.

**FEED:** The supply of all available feed concentrates per animal unit in U. S. is 9 per cent above pre-war but is from 6 to 10 per cent below the past 3 years. Did you read "What Do YOU Think?" in the October 20 issue? If you have good roughage perhaps your net profit would be bigger if you would widen your feed-milk ratio. It's worth study.

In the Northeast since 1941 yearly feed (concentrate) consumption has increased from 11,000,000 tons to over 13,000,000 tons. Dairy cow requirements are up a little, horses and sheep down, poultry up nearly 50%.

If feed should get tight, dairymen would have several choices. They could cull out more low producers, they could raise more home-grown grain, or they could depend more on high quality roughage including pastures, hay and grass silage with the idea that it would then be necessary to feed less grain.

**CABBAGE:** Total New York cabbage acreage this year was 24,000—smallest in a decade. The yield is also down compared to last year when it was unusually good.

On the fall Danish crop, acreage is 11,500; last year, 13,950; 10-year average, 17,670. Yield per acre this year is estimated at 9.5 tons; last year, 14.1. The expected crop this year is 109,000 tons compared to 196,000 last year and a 10-year average of 168,000.

In New York, domestic crop acreage and yield per acre is down slightly below last year with expected crop of 126,000 tons compared to 184,000 last year and 10-year average of 111,200.

In recent years less cabbage has been stored in New York State. Last year those who stored made a killing because the early Texas crop froze. However, storing with that hope is a long gamble. The acreage of the winter crop in Texas this year is 41,900; last year, 42,700, and the 10-year average is 62,400.

**ONIONS:** U. S. onion acreage this year is 102,000; last year, 134,000, and the expected crop this year is 19,400,000 one hundred pound sacks; last year, 23,000,000. In New York the acreage was 15,500—a little above average and the expected crop is 3,642,000 one hundred pound bags compared to 4,000,000 last year and a 10-year average of 3,200,000. The quality this year is reported not too good which means poor keeping quality and probably relatively early marketing. Winter crop in Texas also affects prices of stored crop.

**FIRE:** Farm fires cost \$100,000,000 a year, kill 3,500 people. Check on fire hazards now and eliminate them.

**TAXES:** Recent attitudes of voters and politicians on taxes are dangerous. They must be checked. Here are two illustrations:

1. When the Korean war started we were told that everyone must make sacrifices. But almost immediately Congress, government agencies, and organized groups did their best by wage increases and attempted price controls to see that no civilian sacrificed anything.

2. More recently, labor leaders are advancing the idea that the buying power of "take home pay" must be maintained. In other words, as taxes go up wages must go up too, so the employer would really be paying the increased taxes. If that occurs who will fight for lower taxes and wise government spending?

—Hugh Cosline

## The Song of the Lazy Farmer

WITH winter here and lots of time to stay inside and write this rhyme, I planned to turn a brand-new leaf and work until I had a sheaf of these here "songs" so thick there'd be enough to last 'til spring, by gee. I figured I would buckle down and thus remove the angry frown which editors wear when they must wait for stuff from me that's always late. I told myself no Christmas gift would give those boys a bigger lift than having a three-months supply of copy all set and laid by; besides, I'm getting mighty tired of fearing that I might get fired.

So I collected pen and ink and sat right down to try and think of half a dozen songs or more at which the customers might roar. I hadn't more than just begun when neighbor showed up on the run; "Quick, grab your gun," I heard him shout, "there's pheasants thick as all get out!" Two days of hunting, naturally, required that I rest up for three; by that time it had snowed a bit and rabbits could be tracked and hit.

And so two weeks have slipped right by, two lines is all the stuff that I have writ, and once again this rhyme will reach the printer just in time.

## Store Your Tractor Right

Suggestions for laying up your tractor for winter:

1. When possible, store in a dry, protected place.
2. Wash and clean thoroughly. Paint bare spots to prevent rusting.
3. Clean unpainted parts. Where rust prevention is needed, cover with GULF All-Purpose Farm Grease.

Premium Quality Oil at regular price. Get this handy 5-gallon can at no extra cost.

4. Clean and re-lubricate all open gears.
5. Lubricate chassis thoroughly with GULF No-Rust Engine Oil Grade 2.
6. Drain gear case while warm. Flush with Crankcase Cleaning Oil. Refill with fresh new lubricant, adding 10% GULF No-Rust Engine Oil Grade 2. Run equipment to splash lubricant throughout gear case.
7. Storage batteries should be removed, charged, stored where they will not freeze.
8. Equipment with pneumatic tires should

be blocked to take weight off tires, prevent tires from touching ground.

Get high oil mileage from GULFLUBE, Best Oil Buy For Heavy Farm Work

You'll get maximum value from tough GULFLUBE—"The High Mileage Motor Oil". . .

1. Long life—high mileage—provided by additives giving high oxidation stability.
2. Has properties to prevent bearing corrosion.
3. Manufactured 100% from high-quality paraffinic crude oils by Gulf's Multi-Sol process.
4. Does not thin out excessively under heavy loads.

Tough GULFLUBE is rugged and economical. It provides an extra margin of safety for use under your kind of operating conditions. Use tough GULFLUBE to protect your farm engines, make them last longer, give better performance.

You can't have too many utility cans around the farm. Buy GULFLUBE in the convenient 5-gallon size. The handy 5-gallon can is yours at no extra cost.

USE  
WHEN  
STORING  
TRACTORS

Gulf No-Rust Engine Oil Grade 2 prevents rusting of cylinder walls and other internal engine parts during long idle periods.

Order GULFLUBE Motor Oil  
and GULF No-Rust Engine Oil Grade 2  
From Your Gulf Man Today

Gulf Farm Aids, Dept. G-111,  
Room 1509, Gulf Bldg.,

# Swift's chemically hitched **Blenn** and **Brimm** will boost your yield

## New process **Blenn**

If you grow corn, small grains or other special crops, BLENN is made for you. It is Swift's specialized crop maker with growth elements chemically hitched in each granule. BLENN supplements the growth elements in your soil so your crop gets the nourishment it needs all through the growing season.

For top efficiency from each acre planted, use BLENN. It helps you lower production costs by increasing both yield and quality. For this reason BLENN should be considered an investment... never an expense.

## New process **Brimm**

BRIMM is another specialized crop maker made to supplement the plant food nutrients in your soil. Manufactured in factories in different locations, its balance of plant foods is particularly good for truck crops in the East, Southwest and Pacific

Coast areas. It is tops for cotton and corn in the South.

Both BLENN & BRIMM are made by Swift's New Process. This means they have superior mechanical condition. They store well... distribute through your machines uniformly... no caking, lumping or bridging... and most important, all ingredients are chemically hitched in each granule for even feeding of your crop.

## Question Box

**Our Spanish onions have failed to bottom up. What do you think is the trouble?**

It is not uncommon for Spanish onions to fail to bottom up or bulb well, especially if they are grown from seed. The best way to grow them is to buy or raise plants.

This trouble has been more common the present year, particularly in the areas that have been somewhat cold and wet. It seems to be fairly important for the Spanish onions to make a good vigorous growth early in the season if they are to make good bulbs. Sweet Spanish onions always show thicker necks than others and they do not cure down as well as some varieties, but I assume that your difficulty is a tendency to remain almost like a scallion.—Paul Work.

**Is it true that birdsfoot trefoil will do well on land too poor for other grasses and legumes?**

It is true that birdsfoot will grow on a wider range of soils than other legumes, but its acceptance has been slowed up by the idea that it will grow anywhere. It needs less lime than alfalfa but will respond to lime on very acid soil and if a field lacks fertility, fertilizer should be added before you seed birdsfoot.

**What do you think of the Red Warba potato? Is it a popular brand?**

The Red Warba potato came from Krantz of Minnesota about 1933 and has found a secondary place among potato growers, particularly for those who want an early one, earlier than Cobbler, and a red one. It is round or blocky and it is considered a good home garden and market garden potato. It has not gotten into heavy commercial production.—Paul Work

**Is a 4-inch tile satisfactory for laterals in draining farm land?**

The smallest size that is recommended is 4-inch tile but 5-inch tile is considered better. It is interesting to know that a 5-inch tile will carry nearly twice as much water as 4-inch tile assuming the grade is the same. The larger tile is also much less likely to become clogged.

**Do spittle bugs reduce hay production and can they be controlled?**

Some years back it was generally considered that the damage from these spittle bugs was very slight, but in recent years it has been found that the damage is considerable. The insects can be controlled with benzene hexachloride and one comparison showed an increase of 168 per cent in yield due to the control of the insects while they were still young. It appears that insect control on grasses is going to get more attention in the future.

**Is any progress being made in controlling diseases of alfalfa?**

At the Cornell Experiment Station, work is under way to develop a disease-resistant alfalfa variety which is adapted to the Northeast. The prospects for success seem very good, but it will take several years before such a new variety is commercially available. When it does come, it is probable that yields will be higher and that stands can be kept longer.

**Is there any rule as to the size of a quick freezer that a family needs?**

The usual rule is to provide from 5 to 6 cubic feet of space per person if you plan to produce and freeze a large percentage of your food. However, if you do not plan to produce and store any meat, about 3 cubic feet per person should handle your needs.

### IT'S "AMERICAN"

THIS is just a suggestion but on page one of the October 6 issue under the heading CLAMBAKE, JONESVILLE STYLE, you say, "Into this venture are drawn practically all the people of Jonesville, regardless of creed, and the democratic way in which they work together is remarkable." Then on page seventeen appears, "Its annual Labor Day Clam-

bake has become a proving ground for the democratic way of life —"

Now, that word "DEMOCRATIC," used continually by Dewey in both of his campaigns for President without the slightest doubt defeated him. I believe that had he used the word "AMERICAN" instead of Democratic he would now be our President. I suggest that in the future you use the word AMERICAN in your wonderful

articles.—*Nathan Marshall Southwick, Leicester, Mass.*

— A.A. —

### FOUR GENERATIONS OF FARMERS

I WAS much interested in the letter, "A Great Farm." It set me to wondering how many women farmers there are in New York State, in what counties they are located, and if they chose to be farmers or had it "thrust upon them."

Congratulations to the MacDonalds, that each generation has improved the farm! Surely that is a wonderful recommendation for the farm!

Our farm in Sheridan, N. Y. has been in our family since 1876. Four generations have worked to make it better as the years passed. The previ-

ous owners, the Griswolds, came from Old Lyme, Connecticut, and bought from the Holland Land Company. The house was built in Connecticut style, and the original design has been preserved.

Right now, when the farm has reached the highest production stage in its history, and is all set to produce more and more, we feel that younger farmers should take over. Before I reach the age of seventy, I hope to retire from farm management, although for years we have had excellent workers, and plenty of help available for harvest. How does a person advertise to find a trained horticulturist who has money to invest in a profitable farm?

I am "A retired teacher, a woman farmer, and a person who enjoys work." — *Bessie A. Merritt, Merritt Fruit Farms, Forestville, N. Y.*

— A.A. —

### NO REDRESS

I HAVE about seven acres of husking corn and as you may know here in the Adirondack Mountain foot hills, yields are not large. About two acres of this have been destroyed—nearly 100 per cent. by pheasant and about one acre at least 50 per cent.

Is it necessary for a farmer to submit to such as this, or is there some way to obtain redress? — *Arthur W. Harris, Glens Falls, N. Y.*

— A.A. —

### AFRICAN VIOLETS

HERE is an interesting way to root African Violets. Take one leaf or as many as you wish; put them in a glass with about ¼-inch of water or a little more. Be sure to keep the stem in water at all times. If the water goes down, just add more. In this way you can watch your leaf root and the plant grow. When the plant gets about a quarter of an inch high, take it out of the water and plant it in dirt, being careful not to break the plant from the leaf. When the plant gets about 1 inch high, cut the big leaf off and you can re-root the leaf again.

I have white, pink and purple African Violets which are 1 to 1½ inches in diameter. They are beautiful and were rooted by this method.—*Mrs. R. McLay, R.D., East Greenwich, R. I.*

## It's Handy

### KNITTING HOLDER

To make a good holder for crocheting or knitting with large balls of cotton or yarn, take a one-pound Velvet tobacco can. This has a raised piece in the center which can be pushed out and leaves a round opening for cotton or yarn to run through. Paint the can black and decorate with own design and you have a very attractive, inexpensive but useful holder.—*Mrs. W. R. Fuller, Box 323, Richmond, Vt.*

— A.A. —

### LEMON RIND REMOVES MINERAL STAIN

Instead of throwing away the skin after squeezing a lemon, use it with the adhering pulp to loosen mineral deposits from the inside of teapots or kettles. Simply fill the utensil to be cleaned with luke-warm water, cut up and add the skin of one lemon to each pint of water and allow to soak for four or five hours. Then rinse the kettle with hot water. — *Mrs. Benjamin Hall, Hudson, N. Y.*

— A.A. —

### HANDY RACK

An old rake nailed to the wall above my workbench makes a handy rack for screwdrivers, hammers, and other small tools.—*Andrew Mizcrak, R.D. 1, Carbondale, Pa.*

## "Going to be chilly on that telephone pole today"

Keeping telephone paths clear and service good in Bell rural areas is a year-round job. Often it means turning up coat collars and heading into the storm.

At times the storm is violent, with gale winds, road-blocking snow and ice, or rain for days, followed by floods. Then Bell telephone crews are alerted in all directions — often in several states. They speed to the crippled area with their special skills and tools. And Western Electric, our manu-

facturing unit with supply depots located all around the country, gets all kinds of needed telephone equipment on the scene fast. Soon, repaired telephone lines join in the all-out effort to set the community on its feet again.

In day-to-day telephone work and in emergencies, Bell telephone people have the training to do the job fast and well. That's why the best rural telephone service in the world is right here in America — and it gets better all the time.

BELL TELEPHONE SYSTEM

# You cut milking time in HALF with a McCormick Parlor Milker

McCormick parlor milkers pipe milk from cow to can faster, easier, at less cost. Consider these 8 advantages:

1. Save time—milk more cows with the time saved.
2. Save manpower—many dairymen save on help by one or two men.
3. No lifting or carrying heavy milk cans; no hand straining.
4. Less investment needed in buildings and equipment than with stanchion-type installations.
5. Easy to install. 6. Easy to operate. 7. Easy to clean.
8. Cleaner, more sanitary milk; lower bacteria count.

Ask your IH dealer for full details about McCormick parlor milkers

## 4 models to fit any stall arrangement

Walk-through,  
floor-level  
parlor

**Low-cost, simple design.** The W-2 McCormick parlor milker is easy to install. Ideal for herds of 5 to 25 cows. One man can milk 15 to 25 cows an hour. Requires only 8 x 12-foot space. Additional stalls can be added for larger herds.

Walk-through,  
pit-type  
parlor

**Easiest set-up** is this walk-through, pit-type WP-2 McCormick parlor milker. Operator works in 30-inch pit, flanked by two stalls. Milks 15 to 20 cows an hour. Requires no stooping. Parlor may be enlarged to four, six or more stalls.

U-type  
parlor

**Labor saver**—that's the UP-3 McCormick parlor milker. One man can milk three cows at one time. Recommended for one-man milking of herds of 10 to 40 cows. Milks 20 to 30 cows an hour. Never more than three steps from any milking unit. Five-stall parlor unit may be installed.

In-line type  
parlor

**For long, narrow space.** Ideal installation for most dairy barns. It's the P-2 in-line McCormick parlor milker. One man milks 15 to 25 cows an hour. Additional stalls may be added for larger herds. Operator controls all gates and doors on all parlor units from his working space.

See your IH dealer for all  
your dairy equipment  
needs . . .

McCormick  
Pail Milkers

Soft, gentle action of weighted teat cups promotes cow cooperation, foster milking and more milk with no rough tugging.

New Separator  
Washes Itself!

New McCormick cream separator flushes, power washes, sterilizes and dries itself in 3 minutes; eliminates hand washing drudgery!

New Triple-Action  
IH Milk Cooler

Cools milk to 50°F. in less than an hour twice daily with Triple-Action chilling: (1) NEW ice bank control; (2) NEW agitator control; (3) NEW refrigerating unit with 5-year warranty.

More than 5,400 IH dealers are always ready to give you complete  
IH 5-Star Service on your International Harvester dairy equipment.

## What Do YOU Think?

By JIM HALL

### Is Good Roughage Cutting Your Grain Costs?

**I** HAVE been wondering whether or not some men with top quality pastures are feeding more grain than is necessary per 100 lbs. of milk, so I asked a bunch of farmers to tell us how improved roughage has helped them the most.

Actually, it works out just about the way the experts say: that high grain feeding pays off better in the high producing cows. (According to one fairly recent survey, men with herds averaging about 250 pounds butterfat actually reduced their net when they fed more than one pound of grain for each five pounds of milk, while those with herds averaging 350 pounds of fat could feed up to a pound of grain to four pounds of milk before their net returns started dropping).

#### Buys More Grain

Grain dealers should be happy, too, because lowering the ratio of grain fed doesn't mean that farmers are buying less grain. For instance, Francis Plumb of Springfield, Vermont, one of the New England Green Pasture winners, fed a pound of grain to each 3.1 pounds of milk back in 1947 and reduced this about 25% to 1 to 4 in 1950, but had to buy more grain because his cows were producing a lot more milk.

Francis says, "I have no set rule for milk-grain ratio. I try to feed individually." In addition to the grain, his cows get 50 pounds of grass silage a day when in the barn and 8 to 10 pounds of mow dried hay.

Roland Sweet, Hubbardsville, New York, has only 12 purebred Holstein milkers, but he winters about 30 head and makes about as much from sale of stock as from milk. Since he started an all-grass program six years ago he has had heavier production per cow despite less grain, his labor costs are down, and he can keep more cows on the same acreage. His cattle get about 30 pounds of grass silage, all the good hay they want, and only 1 of grain to each 5 or 6 pounds of milk. He says, "Grassland farming is by far the most profitable way of farming and much easier."

#### Grass Makes Milk

On the A. H. Lindsay and Sons farm at Carroll, Maine—another Green Pasture winner—Mr. Lindsay says the best thing about their improved pasture programs has been the heavier production per cow. This gives me the opportunity to correct the herd average we printed in September in listing the results of the Green Pasture contest: The Lindsay herd in 1950 averaged 13,275 pounds of milk containing 514 pounds of fat. This 35-cow herd in 1946 produced 10,547 milk, 399 fat. He credits the increase largely to better roughage, maintaining a 1 to 3½ grain-milk ratio, and says, "If you have cows capable of producing, it is more profitable to feed the same ratio of grain and get heavier production."

Edward Furman is working on improving 40 acres of pasture on his Mehoopany, Penna., farm but feeds his 17 Holsteins on a 1 to 4 basis. He says, "Grain feeding can be cut to the point where cows get all of the T.D.N.'s they need by Morrison's standards. As pasture gets shorter, I increase the grain, as the short pasture has less protein."

J. Ralph Graham, Jr., who milks 52 Holsteins on his 300-acre Boscawen, New Hampshire, farm, says, "During pasture season we feed all the grain the cows will eat. At times, during July and August this year, we fed as little as 50 pounds of grain while producing 1,200 of milk. (That is about 1 to 24!) Now (late September) the cows are eating 150 to 175 pounds of grain while producing a little over 1,200 milk. They are on good pasture and getting all the fresh chopped corn they will eat." The winter ratio at Ralph's varies from 1 to 4 to 1 to 6, depending on the cow.

#### Milk Up—Grain Down

There are 30 registered Ayrshires milked at the Roy E. Wilcox and Son farm at St. Albans, Vermont, and they believe with improved roughage it is more profitable to cut the amount of grain fed than to go on feeding heavily to run production 'way up. They feed grain at the rate of 1 to 5 in winter and 1 to 8 in summer and tell me they produced 65,000 pounds more milk this year than last, but fed 1,000 pounds less grain. Mr. Wilcox says, "We feed a 12 to 14% ration in order to keep flesh on the cows."

Taking the opposite stand is Burton Froberg, another top Green Pasture man, of Lafayette, Rhode Island. Burton has 50 registered Ayrshires in his milk string, which means his 40 acres of pasture and 60 acres of hay and grass silage land must stay in top shape. He says a man is better off to feed more grain and stimulate more production. Of course he amends this by saying that the selling price of milk and cost of grain must be favorable. Burton feeds at the rate of 1 to 4 which is still less grain than many farmers are using.

From Lincolnville, Maine, Carroll B. Frost says, "The basic idea of the improved roughage program is to produce a maximum of milk for a minimum of grain. If a cow is given the right quality roughage in amounts she is able to consume, I believe there is less need for grain."

Agreeing with his fellow Maine-Stater is Roy Blake of Bethel, who says, "I think if roughage is good, you can feed less grain and keep the health of your cows better with better results than you can with poor pasture and lots of grain."

Now I have a \$64 question: Most of these men are top roughage men with excellent hay and good grass silage. Some are loading in the grain for maximum production, some are easing up on it, figuring that grain savings more than offset the extra production they'd get with more grain. I'd like to know what YOU think is most profitable?

—A.A.—

"Fertilizers represent the most important advance ever made toward providing plenty of food for the people of the earth. By the use of fertilizers it is possible to bring the most barren ground back into production, to maintain the productivity of fertile soils, and to raise the crop-producing capacity of all soils to higher levels. Without their use, the problem of adequately meeting the food needs of the world's two billion people is essentially unsolvable."—Dr. Firman E. Bear.

## Chevrolet's enduring quality is your reward for thoughtful buying

*Size up the Styling*

*Road-test the Ride*

*Put it through its Paces*

...and try Chevrolet's finer Time-Proved **POWERglide** Automatic Transmission\*

The Styleline De Luxe 4-Door Sedan  
(Continuation of standard equipment and trim  
illustrated is dependent on availability of material.)

Inch for inch, pound for pound, feature for feature, Chevrolet sizes up as America's largest and finest low-priced car.

It's longest and heaviest in its field, and you'll know that for a fact by the solid, easy going way Chevrolet takes to the road, by the long, sweeping lines of its Body by Fisher, by the big-car feel when you handle the wheel.

It's far ahead in fine-car features, and every one of them adds greatly to Chevrolet's enduring quality. Unitized Knee-Action ride for more lasting smoothness. Center-Point steering for more lasting ease of handling. Valve-in-Head engine for more lasting economy. Jumbo-Drum brakes for more lasting safety . . . and a score more fine-car, big-car advantages.

More size, more quality, more car for your money in the lowest-priced line of the low-price field! That's your reward for choosing the car more people buy than any other . . . Chevrolet.

See your Chevrolet dealer soon, and find out for yourself what solid value Chevrolet offers. There's a model that's right for your needs. Chevrolet Division of General Motors, Detroit 2, Michigan.

\*Combination of Powerglide automatic transmission and 105-h.p. engine optional on De Luxe models at extra cost.

## Jane Robens Knows Holsteins

INTERCOLLEGIATE dairy cattle judging history has been made during the last few weeks by Miss Jane Robens, of Poland, N. Y., a student at Cornell.

Jane is the first girl to represent Cornell on a dairy cattle judging team. She is the only woman ever to win the highest individual award in the intercollegiate dairy cattle judging contest at the Eastern States Exposition, Springfield, Mass.

And now, she is back from the national intercollegiate judging contest of the Dairy Cattle Congress in Waterloo, Ia., where she set another record. There she became the first woman ever to finish in the top 10. She knocked off fifth high individual in total score for all breeds at Waterloo—but, she made a perfect score in judging Jerseys.

This was the second time a perfect score was ever made at the national contest since it started in 1916, and naturally she is the first girl to roll up a perfect score. She almost duplicated the perfect batting average by scoring 149 points out of a possible 150 in judging Ayrshires.

In capturing her Springfield honors in mid-September, Miss Robens defeated 38 contestants from 13 of the strongest college teams in the east. In Waterloo she was in competition with 93 contestants, representing the 31 top intercollegiate judging teams in the country.

Miss Robens has a herd of 25 Purebred Holsteins of her own back on the home farm in Poland.

### High School Leader

She was salutatorian of the Poland High School class in 1949. Two years earlier she had won a Kraft scholarship of \$200 and a trip to the 4-H Club Congress in Chicago. The same year she was selected as New York State's champion 4-H Holstein girl. In 1948, Miss Robens was a member of the state 4-H club judging team that competed at the National Jersey show at Columbus, O., and the same year won the 4-H showmanship contest at the Syracuse state fair.

Right now, Miss Robens is both a junior and a freshman at Cornell. She

has completed two years of study here and actually is a junior, but she embarked this fall on the first year course in the Cornell veterinary college.

She is the only girl in a class of 50 boys, and one of four girls in the entire veterinary college, there being one each in the freshman, sophomore, junior and senior classes.

After graduating she hopes to affiliate with her father in private practice in Poland. He graduated from the Cornell vet college in 1923. He is W. G. Robens and he exhibited the first prize two-year-old and junior champion Holstein bull at the state fair this year.

— A. A. —

### FREEZING MEAT

Ten years ago there were a lot of questions about the best way to freeze meat. Today it is common knowledge among farm people that we should:

1. Chill carcass promptly after slaughter.
2. Cut pork as soon as it is cold and firm; beef, after aging five to ten days depending on the finish.
3. Wrap snugly in a high quality wrapping material.
4. Store at zero degrees F.
5. Limit the storage period to a reasonable length of time:

Pork ..... 1 to 3 months  
Lamb ..... 6 to 9 months  
Beef ..... 6 to 12 months

There is little question but that these practices result in more satisfaction from freezing meats. The fundamentals of frozen meat storage should be common practice with everyone freezing meat. When people have disappointments in freezing meat, usually one of the above fundamentals has been neglected.—G. H. Wellington.

— A. A. —

Fertilizers have little direct effect on soil structure, but when used to promote the growth of the sod and green manure crops and deep-rooted legumes, fertilizers indirectly re-build the soil. Fertilization, by increasing crop yields, often doubles or trebles the amount of organic matter returned to the soil as crop residue or farm manure.

# PURINA

## CHECKERBOARD NEWS

*Around the*  
**PURINA**  
**FARM with**  
**ELMER POWELL**

DIRECTOR, RESEARCH DEPT.

It's a sad fact, but the average dairyman loses about 15 to 25 per cent of all the calves dropped. We know from experience that these losses can be kept low.

\* \* \*

In 23 years of growing heifer calves at the Farm, we've kept calf mortality under 3 per cent. Last year we lost only one calf out of 43 started. We know we save a lot of calves because of good sanitation. It helps a lot just to keep things clean.

\* \* \*

If you're feeding beef cattle whole corn, it will pay you to follow them with hogs. You can run one hog for each one to three head of cattle, depending on the age and size of the cattle.

\* \* \*

Our English setters in the Dog Unit are kept for feeding tests only and are not trained for hunting. Since the dogs are never "worked," visitors have asked a number of times if they lose their hunting instinct. The answer is no. Even though the females are confined year after year, new males are brought in to the Farm for each new generation. The hunting spirit is kept alive in the pups. This has been demonstrated by the field trial winners and the hunting performance of pups produced in our kennels.

Our two-feed broiler plan is giving outstanding results to growers and in experiments at Purina's Nashua Farm, Nashua, N. H. In a broiler experiment just concluded at the Farm 2,000 New Hampshires, fed on the two-feed system, averaged 2.25 lbs. at 7 weeks, 3.05 lbs. at 9 weeks and 4.25 lbs. at 12 weeks. The mortality rate from hatch to 12 weeks was only 3.59%.

### Highlights of a Purina Dairy Tour in Western New York

by Bruce Symonds

FOR THREE DAYS in early August, dairymen and their families from Erie, Cataraugus, and Wyoming Counties took time off to visit some of the better dairymen in their areas.

This dairy farm tour, sponsored by the local Purinamen, brought out young and old to see and hear how other dairymen are operating their farms and managing their cows.

About 10 A.M. each morning cars and trucks began to roll into the dooryard of the first farm on the day's program. A hot lunch was served at noon. Each day four farms were visited, with the wind-up of the tour by chore time.

Pictures and captions record a few highlights of the three-day tour.

After lunch at the Chafee, N.Y., Baptist Church, John Birkland, Erie County Agent, told the group every dairyman must farm more efficiently to make money.

ROBERT HESS, FORESTVILLE, N. Y. — "This registered bull calf tapes 456 lbs. at 6½ mos. We're raising all our calves on Calf Startena because it saves us both money and milk and turns out bigger, healthier calves. By growing our own replacements, we are building a registered Holstein herd which we could never afford if we had to buy in the heifers."

DONALD CROWELL, SOUTH DAYTON, N. Y. — "Every day we grain our young stock on pasture with D & F. Since we've been grain- ing our heifers, most of them are in the milking string by 24 mos., and do they milk! We had a 485 lb. fat average from our 59 milkers last year with 34 first calf heifers in the string. Some different than when we fed our heifers no grain."

GROVE LEITH, WYOMING, N. Y. — "My daughter, Naomi, and I are plenty proud of this grade Jersey, Star, who made 11,130 lbs. of milk and 509 lbs. of fat in 307 days. We're getting well over a 400 lb. butterfat average with our grade Jerseys because we condition them on D & F a full 60 days before freshening. Also we've started to use only proven sires for breeding."

M. M. RICHMOND, SOUTH DAYTON, N. Y. — "I'm sure we're making more money with our 30 milkers since we gave up cash crops and switched to grassland farming. Better grazing and roughage has meant less grain feeding, plenty of green feed even in dry weather, and extra grass to put up in the flush spring months. We're getting the most from every acre by seeding the proper mixtures."

## These Dairymen Want to Make More Money

by Bruce K. Symonds

### Purina's Dairy Clubs Are Helping Them Do It...

ABOUT a year ago, local Purinamen all over the East started to enroll dairymen in a new kind of record keeping Dairy Club. These were designed primarily for dairymen not already in D.H.I.A. work.

The whole point of these clubs is to help the dairyman make more money simply by the sound method of keeping good records on every cow in the herd. Here's how it's actually being done in the field:

The local Purinaman spends a few hours with a new Dairy Club member listing the names and numbers of all the cows in the herd. After each cow he lists the date last fresh and when she's next due. The dairyman agrees to weigh his milk, night and morning, two or three times a month and record the weights on the chart for each cow. Also he keeps track of the grain he feeds each cow.

At the end of the month, the Purinaman and dairyman figure out the production for every cow. Then they figure the profit she's making over feed cost.

Club members have discovered many poor producers being overfed while some good cows were underfed. Without records, feeding was purely guesswork. Another advantage of keeping records is finding out which cows to grow replacements from.

To many forward-looking dairymen, like Ted Gould of Aurelius, N. Y. (on the tractor), membership in the Dairy Club has meant real help. Ted is just starting with Purebred Guernseys. He is ambitious to build a high-producing, money-making herd. He looks forward to "figurin' up days" when he and the local Check-R-Board Store manager sit down together and work out the records. He's especially interested in checking up on his first calf heifers for they'll be the foundation of his purebred herd.

**More Milk...** Lindsay Clendaniel, local Purina feeding advisor, and dairyman Bill Morris of Denton, Md., check up on the extra milk and profits Bill's been making since he started keeping records. Bill used to overfeed his high producing Holsteins to make sure they'd average 6 cans a day the year round. This guesswork cost him too much money. Now he can tell you how much grain each cow in the milking string needs on pasture or in the barn to keep her milking at top speed.

**Bigger, Healthier Calves...** Pete Himes of Frederick, Md., says he's through buying cows. From now on he's going to raise his own heifers. This fall 8 heifers grown completely on the Purina Calf and Heifer Program will be freshening. With the help of Purina Feeding Advisor Bill Summers, Pete has accurate breeding dates for every one of his 39 milkers. Pete is turning 135 acres to permanent pasture and figures he can now carry 50 milkers as easily as he formerly carried 20.

**Better Condition on Dry Cows...** John Kloos and his son, Glen, of Mercer, Pa., were two of the first dairymen to join a Purina Dairy Club. By checking on their herd record sheet they know what's going on. If a cow isn't making a good profit over feed cost, out she goes. Breeding dates are watched carefully to make sure every cow has a full 60 day dry period. The 6 yr. old Holstein No. 15 (above), fed on Purina D & F during her last 60 days before freshening, gained 163 lbs.

**A More Rounded Dairy Program...** Jack Foote of Elbridge, N. Y., is working with Check-R-Board Store manager Murray Carrigan. Jack found he was overfeeding some of his cows. When Murray advised cutting down on the grain feeding Jack was afraid production would drop, but it didn't. Milk check stubs show he is netting twice as much from 12 cows in 1951 as he did from 8 cows in 1950. Under Carrigan's guidance, improved pastures will carry twice as many cows as formerly.

## CONDITION MAKES EGGS

by DON MUSSER  
Mgr. Purina Poultry Chows

As I travel around the country, I find many poultrymen handling their birds to check condition. If birds are thin on the breast or have been losing weight, these poultrymen take it as a warning of danger ahead.

Usually this does not begin to show up until two to three months after fall production starts. If it goes on unchecked a partial molt or drop-off in eggs is likely to follow.

The reason is simply that today's production-bred pullets sometimes lay faster than normal feeds can supply their needs—for eggs, body maintenance and body growth. Finally Mother Nature says they must call a halt and take a rest.

This is the problem our Research people set out to help solve when they developed Purina Booster Checkers. Booster Checkers are an "insurance" feed in that you feed them during the early fall months to help you avoid difficulties later on in the winter.

You'll also find Booster Checkers a real helper after trouble strikes. They help to pull birds out of egg slumps—by building body condition. They are good to feed following colds or other diseases, because they help build back body condition.

## HOME HANDIES

"When washing dishes use a covered dripless syrup pitcher for dispensing detergents or soap," says Mrs. Homer McCorkle, Coral Ridge, Ky. It helps save soap and the pitcher is decorative enough to keep right on the kitchen drain-board, ready for instant use.

A new use for pop corn is suggested by Miss June Blomgren of Ishpeming, Mich. She says, "For sending anything breakable through the mail, pack pop corn around it. The pop corn is ideal packing material and being so light, it saves postage too."

The first months of production are critical for the pullet—she's building body and laying eggs, too. The pullet builds from one to two pounds body weight from 5 months to 10 months of age. Purina's new Body and Egg Plan is designed to supply pullets with extra nutrients during this critical period when they're still growing and laying heavily.

## Want Your Farm Dog to Earn His Keep?

You can train him to be a real "Hired Hand."

Lloyd Alexander of Wooster, Ohio, is one of countless farmers around the country who have taken advantage of their farm dogs' working ability and desire to help with farm tasks. Money couldn't buy his hard-working dog, Jack. Yet he trained Jack at odd times, as he was able, for the important work he does in guarding and herding cattle and hogs.

### New Purina Farm Dog Book tells and shows you how

Chances are you've a dog or two on your own farm. Put him to work, he'll save you time and trouble and be a better dog besides. The Purina Farm Dog Book—first of its kind in the field—is written especially for farmers. Its 63 pages and 111 descriptive illustrations are packed with information on training, care, housing, and selection of farm dogs. As a special Fall offer this Purina book is Free with purchase of Dog Chow. Use Coupon attached.

Jack drives steers from barn, then holds them back while bedding is put down.

Alexander's Border Collie moves Berkshire sows out to pasture and brings them back.

**Free!**  
of extra cost!  
I enclose a Purina Research Seal of Quality cut from a Dog Chow bag. Send me the Farm Dog Book.

Offer closes midnight Nov. 30, 1951. One Book per Seal.

## Purina's Booster Checkers Show Excellent Results

REPORTS from poultrymen indicate that flock owners are getting good results with Purina's new Booster Checkers.

Many growers who started Booster Checkers early are finding that egg production is remaining high at a time when it normally declines. Some poultrymen are noticing an increase in egg production and a decrease in feed consumption. This indicates that Booster Checkers are supplying needed nutrients which normally require more feed.

Booster Checkers were developed by Purina research to meet the heavier nutritional demands of today's high-producing pullets. They're high in proteins, vitamins, and minerals. In our research work these extra nutrients have proved beneficial in maintaining the body while supporting heavy egg production. This has helped to avoid partial molts and egg slumps after pullets have hit their peak.

Booster Checkers are fed on top of the regular mash. Pullets under 50% production need only 3 lbs. a day per 100 birds. Above 50%, Booster Checkers should be increased to 6 lbs. daily. Right now is the time when Booster Checkers are needed most—to hold up body weight and thus help to ward off egg slumps within a few weeks.

### Young Dairyman Making Good

Robert W. Gillis, (L), Argyle, dairyman, and Fred Norton, Feeding Advisor at Check-R-Board, Glens Falls, N. Y., looking over Bob's herd.

Young Bob Gillis had a small herd of his own, before entering the Navy in World War II. Twenty-two months later Bob returned to dairying. Just 2 years ago he bought the home place from his father. His herd now averages 9,000 lbs. of milk.

Gillis has followed the Purina Dairy Program for the past 3 years.

# N. Y. State Grange Opposes Lime and "Super" Subsidies

**S**EVERAL resolutions adopted at the 79th annual session of the New York State Grange are unusually important as they seem to reflect a growing farm opinion that promises to be vital.

Delegates went on record as opposing that part of the PMA program which pays direct aid to farmers in the form of a subsidy on lime and superphosphate. The Grange also disapproved the family farm policy review as a method of obtaining farm opinion, stating that each agency should stand on its own feet without "blanket approval" and adding that the Grange is against any plan that puts farmers or consumers at the mercy of government officials at public expense.

The cost of farm truck licenses brought forth considerable discussion. By resolution the Grange will cooperate with other organizations in the New York Conference Board of Farm Organizations to work out a proposal to be submitted to the Legislature for the purpose of correcting a situation which farmers believe is unfair.

Last winter the basis for New York's farm truck registration fees was changed from 80 cents per cwt. on unladen weight to 50 cents on the gross loaded weight — a change that will materially increase the cost of plates on many farm trucks.

## Other Resolutions:

### The New York State Grange favors:

The use of country highway equipment by soil conservation districts.

Continuation of the present fox hunting program to control rabies.

Legislation to permit killing deer of either sex when found to be damaging farm property.

Revocation for 5 to 10 years of the hunting license of a hunter involved in a hunting accident, and revocation for life if the accident was fatal.

Selling flavored milk to children in schools providing the butterfat is at least 3.2 per cent.

Urging continuation and extension of drivers' training courses for both young people and adults.

State aid (with adequate safeguards) to local fairs in counties where there is no county fair.

Increased penalties for those who peddle dope to young people.

Legislation requiring car owners to show financial responsibility before being granted a car license.

More State Police and better pay for them.

More consideration to adequate drainage of adjoining fields when road improvements are planned.

Payment by the state of damages done to cars when deer are hit on highways.

Spending more money to build and maintain roads.

Legislation to permit employment of young people over 12 under adequate supervision and with permission of parents.

A thorough house cleaning in government.

### The Grange Opposes:

Any change in the State law forbidding the sale of colored oleo.

Legalized gambling in any form including lotteries, raffles, and bingo.

Daylight saving.

Government development (either state or federal) of more electric power at Niagara Falls. Private industry, they say, can do the job without bureaucracy or expense to taxpayers.

Federal Control of education.

Socialized medicine.

Importation of uninspected milk.

Price controls on meat.

## Officers:

This was Grange election year and following the statement by Henry Sherwood that he was not a candidate

the following officers were elected: Master, Leland D. Smith, Brasher Falls, Franklin County; Overseer, Ralph Young, Endicott, Broome County; Lecturer, Mrs. Florence Pickett, Rock City Falls, Saratoga County; Steward, Clarence Johncox, Corfu, Genesee County; Assistant Steward, Russell Curtis, Cazenovia, Madison County; Chaplain, John Rein, Monroe County; Treasurer, John Kleis, Hamburg, Erie County; Secretary, Harold M. Stanley, Skaneateles, Onondaga County; Gatekeeper, Arthur Speenberg, Hunter, Greene County; Ceres, Lillian Failing, Three-Mile Bay, Jefferson County; Pomona, Leah Benjamin, Horseheads, Chemung County; Flora, Helen Barden, Yates County; Lady Assistant Steward, Lillian Niles, Fort Ann, Washington County.

Henry Sherwood was elected a member of the executive committee for two years. He will serve on the committee with David Kidd and Clyde Hitchcock.

## Achievement Awards

On Thursday evening the AMERICAN AGRICULTURIST Achievement Award was presented by Field Editor Jim Hall to two young Grangers — Kenneth Beightol, R.D. 1, Falconer, N. Y. and Helen Pratt of Greenwich, N. Y. This award in the form of a gold medal is given each year to two young people who exhibit leadership ability in the Grange, 4-H Club, Future Farmers, and the Young Cooperators. Due to the unseasonable snow storm, Miss Pratt was unable to be present.

The Grange membership, as of June 30, reported by Harold Stanley is 143,088. A year previous the membership was 142,518 so there was a net gain of 570 for the year. On June 30 there were 301 Juvenile Granges with a membership of 6,604 as well as 12 newly organized Juvenile Granges with a membership of 288.

The top place in the National Grange Sears Roebuck Foundation Community Service Contest went to Glenridge Grange in Schenectady County. This Grange is, of course, in the running for National honors. The runner-up was Greene Grange of Chenango County, the same Grange that won first place in the State last year and was among the first ten nationally. Third place went to Lowville Grange of Lewis County.

Luzerne Grange of Warren County increased its membership by 67.6 per cent during the year and by doing so won a \$100 prize. Second place went to Shavertown Grange of Delaware County with an increase of 59 per cent.

Gloria Ann Jackson of Pavilion Grange, Genesee County, won first place in the State Highway Safety Essay Contest. Second place went to Janet McBean of Gowanda Grange, Cattaraugus County. Third place went to Carol Pratt of Auburn Grange, Cayuga County.

## Grangers Sing

In the singing contest first for quartets went to the Bethany Quartet, William Buyers, LeRoy; Harold Zehler, Bethany Center; Lloyd Tacner, East Bethany, and Durward Balduf, Batavia, all of Genesee County.

First for soloists went to Warren L. Adams, McGrawville Grange, Cortland County, and first for duets went to Mr. and Mrs. Harry Behler, Hamilton Grange, Madison County and second to Mrs. Philip Collins and Mrs. Charles Young, Genesee Valley Grange, Alleghany County. Third, Mrs. Florence Mable and Mrs. Harriet Shawl, Fayetteville Grange.

# Cash In On Winter Milk!

## Feed KAFF-A

*...the safe replacement for cow's milk!*

Feed Kaff-A to your fall calves . . . and sell your cow's milk during the season of highest prices. Don't lose any of the profits of fall freshening by feeding costly winter milk to your calves.

Kaff-A is the safe replacement for cow's milk in calf feeding. A 50 lb. box releases up to 500 lbs. of whole milk for you to sell. Start Kaff-A the fifth day and from the 10th day you can sell all your cow's milk. Fall calves don't need it . . . and they do need the extra protection in Kaff-A. For Kaff-A is made from nutritious buttermilk, other dairy products, some cereal products and guaranteed, stabilized levels of Vitamins A and D to replace summer sunshine and flush milk from green pastures.

Don't risk your calf's health or lower resistance to winter drafts and cold. Feed genuine Kaff-A and be sure that your fall calves get the nutrition that develops good milkers . . . good breeders. Two million healthy heifers have already been raised on Kaff-A. Get a pail or box from your feed store or milk plant today.

## HOW TO KILL RATS

Simply put Black Leaf® Warfarin Rat Killer Bait in protected places where rats and mice can consume it regularly. They like it and literally eat themselves to death. Because other rodents are not warned, entire colonies are easily destroyed. Black Leaf Warfarin Rat Killer Bait is the amazing new rodenticide — WARFARIN — machine-mixed with special bait material that never becomes rancid. It's ready to use. Get it today and get rid of rats and mice the easy way.

### Also Available as Concentrate

When you prefer to mix your own bait, save money by using Black Leaf Warfarin Rat Killer CONCENTRATE. It makes 20 times its weight in rat and mouse killing bait.

## HOW TO KILL Chicken Lice AND Mites

Use this simple, easy, economical method. Apply Black Leaf 40 to roosts with the handy Cap Brush. Fumes rise, killing lice and feather mites, while chickens perch. One ounce treats 60 feet of roosts—90 chickens.

## "ALL-AROUND"— THAT'S THE WORD FOR ATLANTIC'S FARM SERVICE

That's what Joe Brock said to me while I was filling his house tank with Atlantic heating oil. "Yes sir," I answered, "and it's this truck of mine that turns the trick. It's got two complete systems--tanks, meter and hose for gasoline and tractor fuels, tanks, meter and hose for kerosene and heating oils. No chance for any mixup there!"

When I was finished filling the tank, I took Joe over to the back of my truck, lifted the back door, and showed him the meter. "Here's a dilly of a contraption," I said. "It prints on your meter ticket just how much heating oil, gasoline or tractor fuel I've put in your tanks. You don't even have to be around when I deliver, because you get a permanent record of what you've received."

You can get this "all-around" service from any of these new Atlantic trucks--and believe you me, it'll be the best farm service you've ever had! Call us up at any of the telephone numbers at the right, above. Try us. You'll like the good service, and those good Atlantic products.

## BABCOCK'S HEALTHY CHICKS

MAKE GREAT LAYERS

At the 1950 Storr's Conn. Egg Laying Test our White Leghorns won first all breeds, with 3899 eggs and 4124.5 points. For the fourth time we won the high leghorn pen at the Georgia Test. Other 1950 records were good but not outstanding. In every test entered our Leghorns placed fifth or better. We still hold the all-time World's record for all breeds, all tests won in 1944-45.

**WE HATCH THE YEAR ROUND**  
White Leghorns, Red-Rock Cross, Rhode Island Reds and Barred Rocks. We own two hatcheries with 600,000 egg capacity, three poultry farms, and 15,000 breeders. We carry on a complete pedigree-progeny testing program.

**SEND FOR FREE CATALOG**  
This 36-page illustrated catalog describes our breeding program. Write today for your free copy.

This is the type of waterer that Monroe Babcock prefers. At this end of the trough there is a pipe which takes care of the overflow. The reel is supposed to keep the birds from roosting and usually does, but an acrobatic biddy at the farther end succeeded in balancing herself. Monroe thinks that dividing the reel in the middle and making two sections will cure this difficulty.

## How to Feed and Water Layers

By MONROE C. BABCOCK

**F**EEDING and watering your birds for high egg production is simple. It is easy if you have a flock of clean, well-reared, well-bred pullets. If you like my suggestions here, follow them. If you are getting good results and my recommendations don't agree with yours, forget my article and turn to "Eastman's Chestnut" or "Kernels, Screenings, and Chaff."

Every year I am amazed at how many people don't know how to feed for egg production. Also, I am shocked at the number of well-educated poultry experts who make wrong recommendations on feeding layers. Here are practical suggestions that I know will work.

### Water Is Almost Free

You would be surprised to know how many poultrymen fail to give their birds enough water. True enough, they have water in the pen, but the birds can't get all the water they want when they want it the most. The last two or three years many folks have written or called me and said their pullets weren't laying as well as usual. Upon going to their farms, I found that they had recently installed some of these little water cups in the pens. While they raised a nice flock of pullets that should have been laying better, they weren't getting the production because the birds weren't getting enough water. If you are going to use those little cups that are 3" to 4" in diameter, you ought to have at least one cup for every 50 birds. I haven't seen any research work done on this and I imagine it's high time some was done and definite recommendations made.

When scratch grain is hand fed, the

birds clean it up in 10 or 15 minutes and then they all want to drink at the same time. If they can't all get all the water they want within 5 or 10 minutes, you are not going to get the number of eggs you should. With too few of these little cups, it will take your birds over an hour to get all the water they want to drink.

### My Choice

We prefer either a long trough running the whole length of the house where the birds can drink out of it, either with water that is held at a certain level by a float valve or if the well is good the water is running through all the time. Also, we like a trough about 6 feet long where the birds can drink out of it on both sides for each 300 birds. The water is kept in a trough like this with a float valve and there is a cleanout on the other end that is operated by unscrewing a nipple 5" or 6" long and letting the water run out the drain. Such an arrangement allows a large number of birds to drink at one time and they all can get all of the water they want when they want it.

One reason that you see so many of these automatic cups, etc., these days is that there is great emphasis on labor efficiency because of labor costs. Farmers everywhere are trying to save labor and anything that is automatic looks like a good idea. In a way, these small automatic cups are expensive unless you put plenty of them in. Water is practically free, except for the cost of pumping it, and you have got to get all of the water you can into the birds if you are going to get 75% to 90% production during the flush of lay. Please don't think I am condemning these small automatic cups. I think they are wonderful. But if you are going to use them, for the sake of the hens buy at least one for every 50 layers and, preferably, one for every 25 or 30 layers. Also, install them in such a way that the birds can't knock the tops off of them or upset them so that they flood the pens.

With heavy breeds I think you want these water troughs—no matter what kind they are—down where the birds can stand on the floor and drink out of them. You will get better production. With Leghorns I think you can have treads up 18" or 20" off the floor if you want to and the birds will get up and drink and still do well, but I have a feeling they will do better where they can drink while standing on the floor.

When it comes to mash hoppers, I

PROGRESS IN FARMING AND ECONOMIC TRENDS, reported in the major speeches at the G.L.F. Stockholders' Annual Meeting in Syracuse, October 25-26, were also discussed by groups of farmers and G.L.F. executives. Here Clayton C. Taylor of Lawton, N. Y., left and Albin Karsten of Middletown, N. Y., right, talk with G.L.F. President Frank M. Smith, Springfield Center, N. Y., left center, and General Manager J. A. McConnell, Ithaca. Both Karsten and Taylor are G.L.F. committeemen. The revolving display behind the group is titled "G.L.F. in Action." It depicts with a series of panels the legend, "The G.L.F. Member . . . Elects Committeemen . . . Who Elect Directors . . . Who Appoint Management . . . to Operate Wholesale Facilities . . . and Supply Retail Services for . . . the G.L.F. Member."

# G.L.F. Holds Record Annual Meeting

JAMES A. McCONNELL, general manager of the Cooperative G.L.F. Exchange, in his annual report to 4,000 delegates and employees attending the 31st annual meeting of the Cooperative at Syracuse last month, sounded a note of optimism in regard to the immediate outlook for agriculture but tempered it with a warning that the country may run into some tough going sometime in the middle 1950's.

Basing his statements on the assumption that there would be no war with Russia and that there would be no "wild inflation," the General Manager said he expected a steady price level, high volume of business, high employment, and what "is generally considered good times to continue for the next two or three years."

He predicted that the picture would change sometime in the middle '50's, perhaps late in 1953, saying, "If we are successful in staying out of war with Russia and if we have brought our military preparations up to where Congress and the experts judge they should be, and if we have brought all of these tremendous new facilities, now being built by industry, into production, I think it's proper to assume that we will have to have a business adjustment which will cut volume of business and carry prices down. I don't know how far."

Referring to taxes, Mr. McConnell said, "We don't have to assume that we'll have high taxes; we've got them! They will remain with us the rest of our lifetime. Never before have we been faced with such a long period of continued high taxes. They are the most powerful factor influencing our lives and our business, and we must deal with them realistically."

## President Reports

In the annual report of the president to the delegates, Frank M. Smith of Springfield Center, N. Y., stated: "It can be truthfully said that G.L.F. has been successful over the years in serving the farmers of New York, New Jersey and Northern Pennsylvania by providing feed, seed, fertilizer, petroleum and farm supplies when farmers wanted them, where they wanted them and how they wanted them. By successfully rendering such service, G.L.F. has become a large institution."

In describing its growth, Mr. Smith reported that in the year 1950-51, the

organization shipped 120 carloads of feed each working day of the year; manufactured and shipped to farmers 580,000 tons of fertilizer, superphosphate and lime; supplied farmers with 100 million gallons of petroleum products and sold \$18,000,000 worth of farm supplies to about a quarter million patrons.

## New Facilities

C. N. Silcox, assistant general manager of the co-op, outlined highlights of the organization's operations for the past year. He reviewed progress of operations in the West to bring patrons select, known-origin seeds, announced the completion early this year of a new half-million dollar fertilizer plant at Albany, N. Y., with its capacity of 25,000 tons of mixed goods to help keep up with the increased demands for mixed fertilizers, and described a new fertilizer mixing experiment going on at Oriskany Falls, N. Y.

To further save farm costs, G.L.F. is advocating a grain marketing program to:

- (1) Encourage farmers to keep on their farms all of the grain they can possibly use and a little surplus until the next crop comes around;
- (2) Keep in the local community a supply over and above the grain growers' needs for the use of other farmers in that area who are short of grain;
- (3) Move out of the community to deficit areas or into the grain trade only the surplus above what the local community can use.

## Displays Show Services

The annual meeting was held in the huge new War Memorial Building at Syracuse, and the basement of the building was used for 38 displays designed to portray the progress made in power, crops and livestock phases of farming during recent years.

Directors re-elected to the G.L.F. Board were: Frank M. Smith, nominated by the New York State FBF; J. C. Corwith, Water Mill, N. Y., nominated by the New York State Grange; and the following nominated by the service agencies in the various districts: Harold L. Creal, Homer, N. Y., District 3; George Hummer, Titusville, Penna., District 7; Clifford B. Snyder, Pittstown, N. J., District 9; and Clayton G. White, Stow, N. Y., District 1. Elected to the Board for two years to succeed the late M. C. Albright was Milburn Huntley, West Winfield, N. Y.

**RAISE** registered South American chinchillas. Easier to raise than rabbits and much more profitable. Very reasonable prices. Write Lee E. Loomis, Route 4, Fulton, N. Y. Visitors welcome.

By J. F. "Doc" ROBERTS

**W**HAT are we now feeding our livestock and why? The cold and snow of this past week make that our most important livestock problem. Feed costs and how we handle them this winter will determine the profit or loss on our entire winter operation.

Some of the factors this year include generally an abundance of hay, although a great deal of it is not so-called "good" hay. There is an increased amount of ensilage and most of this increase is grass silage.

Grain and supplements are all high in cost, with every prospect that they will become higher and scarcer as the season advances.

Obviously then, that "poor" hay takes on real importance. From all the information I can gather, "poor" hay may be good feeding hay, and so-called "good" hay may not be such "good" feeding hay. Arguments and experiments are still going round and round on this point. The encouraging feature is that your animals may think more of the hay that you have than you do. You may find that you have to feed more of this "poor" hay, giving your animals a greater opportunity to pick it over and choose for themselves. If this makes for greater waste, it can also relieve your bedding problem. The real importance of all this is to be sure you do not underestimate the value of the hay you have.

## Silage for Grass Feeding

Grass and corn silages are naturals to go with these "got wet" hays. They can be fed almost exclusively over long periods. They too will vary as to what they will do for your animals. The importance of silages in our Northeast livestock picture has only begun to express itself. As you make plans for greater tonnage of silages, you can be sure you are not experimenting but getting your feed problem on a sounder basis.

Grain is really going to be the real problem, except on farms that have been able to grow their own grains. There is, of course, no hard and fast rule about how much grain should be fed, but this year grain could be fed in large enough amounts so that it would not pay for itself in the extra milk or meat it produced. You may be surprised what a small amount of concentrates (oil meals, etc.) and grain coupled with an abundance of your own rough feeds will maintain your production.

Surely some experimentation by you with your animals is called for this year with all your hay, ensilage and grain rations.

\* \* \* \* \*

## More Meat Now

The meat situation has changed from one of scarcity to more than enough to go around. Beef and pork are both plentiful and selling way below ceilings at most places. This is particularly true of cows and cow meats which most affect our Northeast. Every year as regularly as clock work, a rush of cows comes to market in the late fall. Perhaps an educational campaign over the years could help to stem this economic loss to our Northeast farmers and dairymen.

OPS is still struggling for the controls they lost. A great deal of the propaganda they put out is deliberately "smear tactics." They would have you think 99 per cent of all meat and livestock men are crooks. What a shame to be so set on grabbing power and our liberties that they stoop to such abuse of thousands of good hard-working, honest citizens.

Thanksgiving Day, or Farmers' Day as I like to think of it, will soon be here. May it carry the reverence and thanks as I remember the day in the big front room and the living kitchen of my grandparents in New England.

— A. A. —

## FERTILE SOILS FOR WHEAT

Wheat grows best on fertile, well-drained soils, according to New Jersey agronomists Garrison and Baylor. The crop must be supplied with an abundance of plant food, and liming is always important.

Where fertilizer and manure have been applied heavily to preceding crops in the rotation, 300 to 500 lbs. of 4-12-8 fertilizer per acre should be applied at seeding time. If wheat follows a heavily manured or fertilized crop, substitute 0-12-12 for the complete fertilizer.

If the wheat is used as companion crop for legume seeding, an additional 500 lbs. of 0-12-12 should be broadcast before plowing or drilled deeply after plowing. Reinforced barnyard manure at the rate of 5 to 10 tons per acre may be substituted for the 4-12-8 fertilizer recommended for use at seeding time.

— A. A. —

## NEW WEEVIL PROTECTANT

It is estimated that grain weevils cause a loss of around one-half billion dollars a year in this country. Until recently, control methods centered around fumigation, but now a new product is on the market called Pyrene which can be mixed directly with the grain. It's non-toxic and is not found in the flour from the wheat.

Also on the market is paper which has been chemically treated so that food, when wrapped in this paper, is protected against various types of insects.

## COMPLETE JERSEY DISPERSAL SALE

AT HOLLY BEACH FARMS

Estate of Wm. H. Labrot, Owners, ANNAPOLIS, MARYLAND

TUESDAY, NOVEMBER 20, 1951

100 HEAD — SELLING — 100 HEAD

HERD ENTIRELY ACCREDITED FOR BANG'S AND T.B.

Sale will start promptly at noon and will be held on the farm, 8 miles N.E. of Annapolis on Route U. S. 50. Lunch will be served on the farm. Established in 1913, this herd has long been considered one of the top herds in America. Herd testing has been carried on for 15 years and the herd has topped many classes at leading Eastern Shows. Everything will sell—60 cows in milk, mostly fresh or heavy springing, by such well known sires as MALAGA—NOBLE DANDY and WAR BREAD SYBIL BLONDE. Three very choice herd sires and some 35 heifers of all ages are included.

# Letter for THANKSGIVING

Dear Daughter

WE will miss you and Tom at Thanksgiving, but how nice that you'll be here all Christmas week!

You asked for help in planning your dinner. Have the things that you and the family particularly like, but keep it simple, and not too much last minute preparation: A juice—hot or cold, plain or spiced, or clear soup; a bird; two or more vegetables, one as a salad if you want; relish; bread or rolls; dessert.

Our two "musts" have always been tiny onions, creamed, and sweet pickled peaches. You used to fix the onions for me the day before (sometimes weeping!), while I made the dessert.

A hot steamed pudding is nice, but takes time and stove space while you're getting dinner. I'll include a gelatine plum pudding which can be made the day before. Do you remember the simply yummy pumpkin pie Mrs. McArthur used to make for us? It wasn't made according to Hoyle, but was so good, and I could never make one quite as she did. Once I had her make pies for a party, and when Grace asked for the recipe, Mildred said, "Oh, Nan doesn't make her own pies!" I've made them ever since! You may have the recipe, result not guaranteed, so try it first on the family.

Of course, you realize taste in pumpkin pie is varied—we happen to like one with little pumpkin and lots of spice, but lots of people prefer a lot of pumpkin and little spice. To really dress up your pie, serve it with whipped cream, topped with a heaping teaspoon of plum jam, or any colorful tart jelly.

(A bit heavy after a big dinner, but nice for a dessert party.)

Here are the dessert recipes and you can take your choice:

1 baked pie shell  
3 egg yolks, slightly  
beaten  
1 cup sugar (½ brown,  
½ white)

## PUMPKIN CHIFFON PIE

1¼ cups cooked or  
canned pumpkin  
½ cup milk  
2 tablespoons molasses  
½ teaspoon ginger  
½ teaspoon nutmeg

½ teaspoon cinnamon  
½ teaspoon salt  
1 tablespoon gelatin  
¼ cup cold water  
3 egg whites, stiffly  
beaten

To the slightly beaten egg yolks add ½ cup of sugar, the pumpkin, milk, molasses, spices and salt; mix well and cook in a double boiler until thick. Soak the gelatin in the cold water, and add to the hot mixture; mix well and cool. When the mixture begins to thicken, add the remaining sugar and fold in the stiffly beaten egg whites. Pour into a baked pie shell. Chill well before serving.

1 tablespoon gelatin  
½ cup cold water  
1 cup milk  
½ cup seeded raisins

## PLUM PUDDING

¼ cup currants  
¾ cup chopped dates  
½ cup sugar  
3 tablespoons cocoa  
¼ teaspoon salt

¼ cup chopped nuts  
¼ teaspoon vanilla  
2 egg whites, stiffly  
beaten

Soften the gelatin in the cold water. Combine the milk and fruit in the top of a double boiler and cook slightly. Mix the sugar, cocoa and salt and add to the fruit mixture; add the softened gelatin and stir until dissolved. Remove from the heat, cool, and when the mixture begins to thicken add the nuts, vanilla, and fold in the egg whites. Turn into a mold and chill thoroughly. Serve with a thin fruit sauce, or whipped cream. 6 servings.

## MRS. McARTHUR'S PUMPKIN PIE

½ cup cooked or canned  
pumpkin  
1 egg

1 cup sugar  
½ teaspoon cinnamon  
½ teaspoon ginger  
¼-½ teaspoon nutmeg

1 tablespoon flour, stir-  
red smooth in cream  
2 cups milk

Mix the ingredients in the order given. Pour into an unbaked pie shell. Bake in a moderately slow oven, 325° F., for 3 hours. Mrs. McArthur always spiced by taste, but I gave you measurements—try tasting. The oven temperature and baking time are not those generally approved for pie—but that's the way she did it. Remember—I warned you. You may bake it like a custard pie—450° F. for 10 minutes, then at 325° F. for about 30 minutes, or until the mixture doesn't adhere to a knife. One 9-inch pie.

## SUET PUDDING

1 cup finely chopped  
suet  
1 cup molasses  
1 cup milk

3 cups flour  
1 teaspoon soda  
2 teaspoons salt  
½ teaspoon ginger  
½ teaspoon nutmeg

¼ teaspoon cinnamon  
½ teaspoon cloves  
Raisins and currants, if  
desired

Add the molasses and milk to the suet and mix well. Sift together the dry ingredients and add to the suet mixture (also fruit if used). Blend the mixtures

—Photo: Poultry & Egg National Board

Nothing in the world tastes so good as the Thanksgiving Day bird when it's done to a turn, tender and juicy inside, crisp and golden brown outside.

By

ANNA

ROGERS

WILLMAN

You can give an autumn touch to your pumpkin pie by decorating it with "cheese leaves." Cut leaf pattern on cardboard, place on thin slice of cheese, and cut around it with a sharp knife.

quickly, and pour the batter into greased molds. (No. 2 tin cans make good molds. Be sure to cut the tops off, so the pudding will slide out). Cover the molds and steam for 3 hours. Serve with hard sauce. 8 to 10 servings.

Of course, if you want a lighter dessert than pudding or pie after your Thanksgiving dinner, you might have lemon jelly (you and your fondness for lemon!) or any fruit or wine jelly, with crisp sugar cookies.

All this makes me want to get started. I think I'll make a couple of extra suet puddings and put them in the freezer. Those I freeze I cool quickly and package. They freeze beautifully, and are so nice to have in an emergency. Dad left me the car today, so I'll go do the shopping right now.

Good luck and good eating.

Love,

Mom

## THANKSGIVING DAY

By Eleanor Alletta Chaffee

A kitchen is the place to stay  
Just before Thanksgiving Day:  
Pies and cakes pop in and out  
Of the oven, piping hot.

There are icing spoons to taste,  
Batter bowls to scrape in haste,  
Bits of cake within the pan:  
Have a sample while you can.

Nothing smells so fresh and nice  
As the scent of dough and spice.  
Forget your work, forget your play  
The day before Thanksgiving Day!

# A PARTY FOR Old and Young

By DOROTHY WELTY THOMAS

**H**AVEN'T you sometimes wished that you could throw a party where you could include all the members of your own family and the neighbors too—all ages from seven to seventy, and everyone have a good time? Well here is an idea for a party that is neither expensive nor very much work. The idea grew out of an old Swedish custom, but it is similar to our old-fashioned quilting and husking bees.

One winter I belonged to a group that met once a week to make things—anything that you wanted to make by hand. It was started by a teacher of folk-dancing who wanted some craft work to display at her Santa Lucia festival—the culminating event of a class in folk-dancing. It is an old Swedish custom to gather together at Christmas time, sing and dance, and show the handiwork of the year in a kind of fair. She thought it would be fun if some of her friends would make such things as hooked rugs, hand-painted Christmas cards, and knitted articles, and exhibit them at the festival or recital, just to keep the custom as she had known it in Sweden.

We had so much fun at these gatherings that after the festival we kept right on meeting once a week on winter evenings for a couple of years. We took any odd jobs we could carry around with us and worked in front of open fires and talked as we worked! We kept it very informal, so that sometimes it would be one group and sometimes another. If the young folks wanted to go skating first and then come in to help clean up the mess and eat what was served, that was all right, too!

This kind of gathering makes a good opportunity for the men to get together and indulge in their hobbies, too. If they aren't the kind that like to whittle, etc., they can talk politics or business. Many men do have hobbies and it is amazing how many come to light at such gatherings.

Grandma can cut rags for rugs, and the little fellows can cut and paste. Some of the projects suitable for such a gathering are the making of Christmas wreaths, pasting recipes in scrapbooks,

mounting snapshots, mending, painting Christmas cards, finishing birdhouses and knife-racks. Some of the boys will like to work on ship models and the like. In some communities wood-carving and basket-making would be popular.

Open out your big extension table or lift drop-leaves. Spread thick layers of newspaper for the painting and other messy projects. Provide plenty of light even if you have to borrow lamps from your neighbors. If the crowd is large, some of them won't mind sitting on the floor—in fact, the floor is ideal for some kinds of work.

Serve simple refreshments—something like a dishpan of popcorn and bowls of well-polished apples placed on each table. They may like to bite on these while they work. And almost everyone likes to crack nuts. For not too large a group, hot, spiced grape-juice served with cookies, doughnuts or fruitcake is super.

Call your guests far enough in advance so that they

can assemble necessary materials to bring with them. A neighborhood group could have a series of these parties to make things for a bazaar and raise money with their products for the church or some other community project.

There are many good how-to-do-it books in libraries today on almost every kind of handicraft. They will suggest ideas if you have not done this kind of thing before. "Handicrafts of New England," by Allen H. Eaton, published by Harper & Brothers, is such a book, and there's another good one called "Handicrafts For the Fun of It."

Educational Materials, Inc., 46 E. 11th St., New York, N. Y., have hand-craft kits on almost every kind of arts and crafts project you can imagine, from how to make Indian moccasins to how to make a rush or cane seat. Kits contain both materials and instructions, and range in price from \$1.50 to \$5.00, depending on the materials included. This company also publishes a book with simplified instructions on all kinds of crafts, called "Craftsman's Instruction Handbook," that sells for \$1.50.

## HOMESONG

By Elaine V. Emans

It is a little thing to stir the pride:  
A quart of pickles taken  
from a shelf  
Which held them since July, or  
curtains wide  
Of ruffle, and snowy, one  
has ironed one's self;  
Or gingerbread, or a jewel-  
glass of jell,  
Or a rug crocheted, or a let-  
ter to comfort hearts;  
But oh, how lovely is it, know-  
ing well  
One's hand is skillful at so  
many arts!

It costs less to own a

# Speed Queen

## DOUBLE WALL CONSTRUCTION

- ... keeps water hot
- ... keeps you cool
- ... protects tub inside
- ... strengthens washer

Here's how a Speed Queen saves you money:

1. YOU SAVE when you buy because a double-wall Speed Queen costs less than most single-wall washers.
2. YOU SAVE hot water and soap because it is necessary to fill the tub only once for an average wash.
3. YOU SAVE on repair bills because a Speed Queen is built for trouble-free service and long life.
4. YOU SAVE time because a Speed Queen will wash up to 7 loads of clothes per hour.
5. YOU SAVE on depreciation because a Speed Queen will give many years of extra service.

The letters below are typical—among two million Speed Queen users.

Just read your ad in a current magazine about the washer with a "trouble-free future." How'd you like to hear about a washer with a trouble-free past? My Speed Queen is over 16 years old, has never seen a repair shop. I promise you that when we get a new washer, it will be another Speed Queen.  
MRS. B. BENEVENTO, Vallejo, Calif.

When a piece of household equipment just goes on and on, serving the weekly washing requirements of a family for a period of over 20 years, that information should be given to its makers. Our Speed Queen has done just that, and it appears to be capable of many additional years of service. My next washer, I assure you, will be a Speed Queen.  
MRS. L. S. SHEPARD, Oshkosh, Wis.

I have had a Speed Queen washer for 17 years. It is still doing a good job. The only replacement, which cost us 45c, was the small brass ring on the agitator post. For washing fine clothes as well as heavy garments and rugs, it is unsurpassed. Your new machine is beautiful; one could wish for nothing finer.  
MRS. J. LIEBERMAN, Cleveland, O.

See your Speed Queen dealer, or write the factory for literature.

SPEED QUEEN CORP.

Mrs. Elizabeth Fisher delighted with Active Dry Yeast.

## Rhode Island Woman First-Prize Winner in State Grange Cooking Contest

Mrs. Elizabeth J. Fisher of Quonochontaug, R. I., shows her husband the ribbons she won at the 1950 State Grange Cooking Contest. She was chosen to represent her home grange in this state contest . . . and walked away with first prize! This was Mrs. Fisher's first cooking competition and she is delighted to be a winner. She is also delighted with Fleischmann's Active Dry Yeast. "It's so fast working and easy to use," says Mrs. Fisher.

"Gives me real prize-winning results." It's true! Yeast-raised treats are delicious . . . and so nourishing. Nothing can top their rich, delectable flavor—nothing makes more of a hit with the menfolk either. When you bake at home—use yeast—Fleischmann's Active Dry Yeast. It's the best ever . . . easy to use, fast dissolving. Buy a supply soon—when you bake at home, delight your family with yeast-raised goodies.

## It Calls for Compliments!

It's made with  
**DAVIS**  
"double action"

### 1-EGG CAKE

- |          |   |   |
|----------|---|---|
| STEP I   | 1 3/4 cup Cake Flour<br>1 cup Sugar<br>3/4 tsp. Salt<br>1/3 cup Milk<br>1 Egg | 1/3 cup Shortening<br>(emulsified type<br>such as Crisco,<br>Spry or Swift's)<br>1 tsp. Vanilla |
| STEP II  | 2 3/4 tps. DAVIS BAKING POWDER  |   |
| STEP III | 1/2 cup Milk  |   |

Combine and  
beat smooth  
(2-3 minutes)

Stir in quickly  
Blend gradually  
into batter; then  
beat for 1 minute

Bake in two 8-inch round pans for about 25 minutes at 365°F  
Frost with Swel — chocolaty, creamy-smooth — another Davis product.

Try this quick-mix 1-egg cake. It's so easy! And Davis Double Acting Baking Powder gives it lightness and texture you'll be proud to sponsor! Double action means: the batter rises twice—first in the mixing bowl and again in the oven. That means super-lightness—even when you're delayed getting it in the oven. Try it! Send for set of "Quick-Mix" Charts: R. B. Davis Co., Dept. AA-9, Hoboken, N. J.

GIVES A **LIFT** TO YOUR BAKING

## Softly Tailored 2596

No. 2462. Shoulder pleats, curved collar, six-gore skirt are used to soften a useful tailored dress. Short sleeves, collarless neck, too. Note size range, 16-20, 36-50. Size 18, 4 yds. 39-in.

No. 2596. This trim weskit suit has an extra little weskit for mix-match magic! Sizes 10-20. Size 16, pleated skirt with V-neck weskit, 3 yds. 54-in.; collared weskit, 1 5/8 yds. 54-in.

No. 2544. A smart slenderizer is this flared princess home frock with waistline gussets. Simple to cut and sew—choice of sleeves, necks. Sizes 12-

20, 36-40. Size 16, 4 1/8 yds. 35-in.

No. 2481. Not one but TWO basic wardrobe stretching skirts—both with back-zipper closing. Waist sizes 22-34. Size 28, pocketed, 1 1/2 yds. 54-in. Pleated, 1 3/8 yds. 54-in.

TO ORDER: Write name, address, pattern size and number clearly. Enclose 25 cents for each pattern wanted. Add 25 cents for our Fall-Winter Fashion Book which has attractive pattern designs for all ages, sizes and occasions. Send to AMERICAN AGRICULTURIST PATTERN SERVICE, Box 42, Station O, New York 11, N. Y.

## Along the South Hill Road — We Count Our Blessings

By INEZ GEORGE GRIDLEY

OUTSIDE the wind is beginning to complain and stir up a few flurries of snow but our kitchen is an oasis of light, warmth, and cheer.

The good smells of apple butter bubbling on the stove and the last batch of relish simmering have given way to the Thanksgiving baking. Dark, moist "boiled" cake, pudgy with raisins and currants, the heavenly fragrance of pumpkin pies, homemade mince meat and fat molasses cookies all contribute to the Thanksgiving climate in the kitchen. The great bird is stuffed, ready for the oven. In the pantry there's a special Hubbard squash, earmarked for the feast. Plump yellow onions and potatoes raised on the red slate meadow are waiting to accompany the bird.

The cellar is the real farm treasure house. From the bounty on the shelves I pick out a glass of plum conserve, sweet pickles, deep green and translucent, and crisp, salty dills, olive green in the big stone jar. Some tomatoes, picked green and carefully put away in paper for just this occasion, are un-

wrapped to add a note of color to a big green salad.

Two-year-old Linda Anne is bubbling with excitement. Brother dashes in, to keep off the pangs of starvation with a cookie or two. No need to worry about spoiling his appetite! Every farm mother of a twelve-year-old knows he is hollow as far as eating is concerned. Sister is setting the table carefully, with an eye to the all-over effect. Lately she has been exchanging a preoccupation with food for an interest in clothes, but she will give a good account of herself at the Thanksgiving table.

When the grandparents have arrived and we are gathered around the long table, the best sauce for the dinner will be the knowledge that this feast is the result of a year of work and planning. Brother is as proud of that big squash as if he had invented it.

With gratitude for the good harvest and warm enjoyment of the family gathered together, we count our blessings once more. Thanksgiving has a deeper significance on the farm, where we know how thin the line is between want and plenty.

# Chocolate Cake Contest Won By Mrs. Carl Learn

**FIRST: Mrs. Carl Learn**  
Winner of International Harvester Refrigerator

**SECOND: Mrs. Doris E. Berry**  
Winner of Speed Queen Washer and "Cheer"

**THIRD: Mrs. Kenneth Bellinger**  
Winner of Kalamazoo Gas Range

**FOURTH: Mrs. George Causebrook**  
Winner of General Electric Radio from Co-op. GLF

**H**OW do you feel when the telephone rings and you are informed that your cake has been rated No. 1 by the judges in the Grange-AMERICAN AGRICULTURIST Chocolate Cake Contest? You feel terribly thrilled and speechless, says Mrs. Carl Learn of R.D. 2, Horseheads, N. Y., whose entry topped all others in the contest finals at State Grange annual session in Syracuse.

Mrs. Learn's cake was one of fifty-three baked by that many finalists, each of whom had won top honors in her own county. The county contests were preceded by Subordinate Grange elimination contests in which five thousand Grangers took part.

So uniformly excellent were the entries in the state finals that these three Home Economics experts spent eight hours judging the cakes: Miss Lucille Brewer, superintendent of the New York State Fair Foods Contest; Dr. Jean Simpson of Syracuse University Home Economics Department, and Miss Virginia Salisbury, Onondaga County assistant Home Bureau Agent. Commenting on the entries after the judging, Miss Brewer said it was amazing to meet such uniformly high standards and excellent technique in such a large contest.

The 27 highest scores were earned by the following winners in this order:

## STATE CONTEST WINNERS

1. Mrs. Carl Learn, Horseheads, Chemung Co.
2. Mrs. Doris E. Berry, Watkins Glen, Schuyler Co.
3. Mrs. Kenneth Bellinger, Sharon Springs, Schoharie Co.
4. Mrs. George Causebrook, Little Valley, Cattaraugus Co.
5. Mrs. Herman Reinshagen, Swan Lake, Sullivan Co.
6. Mrs. James Kirkwood, Sr., Honeoye Falls, Monroe Co.
7. Mrs. John B. Holloway, Amsterdam, Montgomery Co.
8. Mrs. Mable Fortune, Adams Center, Jefferson Co.
9. Mrs. Ethel Hartranft, Fayette, Seneca County
10. Mr. Floyd B. Groff, St. Johnsville, Fulton Co.
11. Mrs. F. Otto Schmidt, East Chatham, Columbia Co.
12. Mrs. Nellie Gould, Spencer, Tioga Co.
13. Mrs. Grace Hagar, Plattsburgh, Clinton Co.
14. Mrs. Helen Youker, St. Johnsville, Herkimer Co.
15. Mrs. James Sanford, Preston Hollow, Albany Co.
16. Mrs. Ben Willis, Burke, Franklin Co.
17. Mrs. Vera Friends, Osceola, Penna., Steuben Co.
18. Mrs. Jay Dodds, Heuvelton, St. Lawrence Co.
19. Mrs. Vernon F. Wells, Riverhead, Suffolk-Nassau Co.
20. Mrs. Russell E. Luce, Groton, Tompkins Co.
21. Mrs. Frances H. Parker, Homer, Cortland Co.
22. Mrs. Anna Marie Walton, Bliss, Wyoming Co.
23. Miss Elizabeth R. Getty, Rock Tavern, Orange-Rockland Co.
24. Mrs. Alfred Marolf, Beaver Falls, Lewis Co.
25. Mrs. Gerald King, Tully, Onondaga Co.
26. Mrs. Albert C. Barie, Bethany, Genesee Co.
27. Miss Eunice Hill, Kennedy, Chautauqua Co.

## They Got Prizes!

Every one of the 53 finalists received a \$3.00 entry prize from the New York State Grange. The 27 high winners received the following cash awards, totaling \$100.00, from American Agriculturist: 1st prize, \$25; 2nd, \$20; 3rd, \$15; 4th, \$10; 5th, \$5; 6th, \$3; 7th, \$2; 8th to 27th, \$1 each.

Six grand prizes were awarded:

Mrs. Learn, the No. 1 winner, chose the International Harvester Refrigerator from International Harvester Co., Chicago, Illinois.

Mrs. Berry, No. 2, took the heavy duty Speed Queen Washer, given by Speed Queen Corporation, Ripon, Wisconsin, and a year's supply of Cheer.

Mrs. Berry said she chose the washer because she has had a Speed Queen for thirty years and liked it so well that she wants another one.

Mrs. Bellinger, No. 3, got her first choice also: a Kalamazoo Combination Gas and Wood Range, awarded by the Kalamazoo Stove and Furnace Co., Kalamazoo, Michigan.

Mrs. Causebrook, No. 4, took home a model 408 General Electric Super-Powered FM-AM radio given by the Cooperative G.L.F. Exchange, Inc.

Mrs. Reinshagen, the fifth high winner, got a Deluxe Console Speed Queen Ironer from the Speed Queen Corporation; and No. 6, Mrs. Kirkwood, received a Zenith FM-AM Radio from G.L.F.

Each of the 10 highest winners also received:

A Domino Overnighter (overnight case) filled with Domino products (Crystal Tablets, Granulated Sugar, Confectioners XXXX, Pressed Tablets,

Superfine Sugar, Old-Fashioned Brown, Light Brown, Dots, Sugar and Cinnamon, Wrapped Tablets, and Superfine Packets) from American Sugar Refining Co., New York, N. Y.

A 9-inch high Wicker Hat Box filled with Walter Baker products (Breakfast Cocoa, Instant Sweet Cocoa Mix, Dot Chocolate, Unsweetened Chocolate, Semi-sweet Chocolate Chips, German Sweet Chocolate; Recipes, cake pans, and cake cooling racks) from Walter Baker Division of General Foods Corp., New York, N. Y.

Four 5-lb. sacks G.L.F. Flour (Quality Patent, Quality Pastry, Vita-fed Pancake Mix); and 2-lb. sack G.L.F. Cake Flour, from Cooperative G.L.F. Exchange, Inc., Mills Division, Buffalo, N. Y.

Davis Baking Powder, Cocomalt, SWEL, Cook Book and Quick Mix Baking Charts from R. B. Davis Company, Hoboken, N. J.

\$2.00 in cash from General Foods Sales Co., Certo Division, New York, N. Y.

One case of Hazel-Atlas quart Seal-All Mason Style Jars from Hazel-Atlas Glass Co., Wheeling, W. Va.

One 25-lb. sack Robin Hood Flour from Robin Hood Flour Co., Minneapolis, Minn.

This contest was the 16th annual baking competition to be sponsored jointly by the Grange and AMERICAN AGRICULTURIST, and was a project of the State Grange Service & Hospitality Committee. Mrs. Herbert Thomsen of Stanfordville, N. Y., the 1951 chairman of the committee, and Mrs. Mabel Hebel, A.A.'s Home Editor, directed the contest. Working with them were hundreds of Subordinate Grange S. & H. committee chairmen and 53 Pomona committee chairmen.

**FIFTH: Mrs. Herman Reinshagen**  
Winner of Deluxe Speed Queen Ironer

**SIXTH: Mrs. James Kirkwood, Sr.**  
Winner of Zenith Radio from Co-op. GLF

# A Deal in Livestock

By GEORGE DUFF

(Reprinted from an old issue of the Dairymen's League News, courtesy of George C. Lee, Editor.)

THAT there hoss," said Old Man Holman, "don't look to me as if he was worth more'n a thousand dollars, but there may be some valuable p'int about him that I can't see. What kind of a recommend d'ye put on him?"

"Absolutely kind and true and'll work in any harness," replied the Tin Peddler.

"Kind and true," agreed the horse dealer, "but not what you'd call sound and true."

The Tin Peddler whittled a pine sliver into a toothpick, clamped his jaws upon it and gazed reproachfully at his antagonist. "Well, now, Rufus," said he, "you wouldn't exactly take me for a dummed fool, would ye?"

"That'd depend on circumstances," allowed Holman.

"Well," said the Peddler, "when I'm makin' a hoss deal, them circumstances ain't present to the extent of my recommendin' a critter to be sound that's got a bog spavin on him a one-eyed man could locate at ten rod. Don't hurt him a mite, and he's never been lame in it a minute, but it's there for anybody to see that knows the difference between a hoss and a hay-rigging."

"Uh-huh," grunted Holman, "I've seen one or two of them bog spavins before an' I never knowed a hoss with one of 'em but what his owner claimed that it kind o' helped him along if anything. What do you hold the critter at?"

"Never set any price on him, but I'd hate to take less 'n a hundred. My only object in dealin' him is that he's a little too slow for the nigh one there. Anything I hate is a team with one hoss a-goin' an' the other a-comin', and he just simply can't keep up. Place for him is off the road an' onto a farm, and with a little judgment he's worth two hundred of any man's money to wear out on a plow 'r lumber-wagon."

"Prob'ly you're right, Abner," said Holman. "Prob'ly you're right about that 'ere, only I'd think that the man who could git two hundred dollars out o' that old skate on a farmin' job wouldn't have no business a-tillin' of the soil. Be kind o' wastin' his talents and blossomin' unseen on the desert air. You might, though, get a hundred for him in a deal, same as the feller did who sold his old dog for a thousand."

"How's that?"

"Took his pay in pups. Four pups at two-fifty apiece. What kind of a critter are you lookin' to swap him for, anyway?"

"I'd like something that would match up pretty well in size and gait with the nigh one. Don't mind about its bein' a leetle mite lighter, only I don't want no mustangs. If I could find something to suit me, I wouldn't mind givin' a trifle of difference, but I wouldn't calculate to make you a present o' my hoss an' give full cash value for your'n."

"Talkin' cash in a deal?" inquired Holman.

"Talkin' nothin' else. When I want any credit I'll go somewheres where there ain't goin' to be no argument over chattel mortgages an' property notes."

"All right," said the horse dealer. "Jerome," he called to his son and

assistant, "lead out the Wooster mare!"

After an interval of backing, whoaing, and low commands not untinged with excited emphasis, the younger member of the firm appeared at the barn door with a quadruped of indeterminate description, bow-legged, high-headed, wild eyed, and having, as she advanced into the open, a gait which combined that of the elephant with the double-jointed shuffle of the dromedary. The Tin Peddler seized her expertly by the jaws, took a brief survey of dental conditions, and stepping back a pace gazed at the creature for a moment in silence.

"I wouldn't 'a' thought it of ye, Rufus," he said at length and in accents of profound melancholy and reproach. "I wouldn't 'a' thought it of ye, after you've knowed me, man an' boy, for more'n thirty years!"

"What's the matter now?" demanded Rufus.

"You've knowed me," the Peddler went on mournfully, "for more'n thirty years, but that ain't nothin' to the length o' time I've been acquainted with that there old mare. First hoss I ever owned, I think, and although that was a lifetime ago, clippin' her an' dopin' her up ain't a-goin' to make such a change that I won't recognize the old Jezebel!"

Holman grinned cheerfully as he directed his son to return the mare to her stall. "I just fetched her out for a joke," said he, "but I might 'a' knowed there wasn't no foolin' a feller like you. You cut your eye-teeth on hoss swappin' along about the same time I did, and I dunno but what you can hang it onto me in a deal oftener'n I can you."

"Soft words butter no parsnips," reproved the Peddler. "When you begin to talk that way, Rufus, a feller wants to look out for a good skinnin'."

"All right," said Rufus. "Jerome," he shouted in tones of almost triumphant pride of possession, "bring out the little Cady Hoss!"

When Jerome appeared again at the door he was accompanied by a prancing, dancing, round-barreled, sleek-coated little bay gelding with a full, kind eye and a wealth of dark mane and tail, apparently every inch a perfect horse.

"What about him?" inquired the Peddler after looking him carefully over.

"Give you a written guarantee on that hoss if you want it," said Holman. "Perfectly kind an' true in any spot or place, and not a mark 'r blemish that you can find on him. I've got twice the amount in the critter that I ever expect to get out, an' I'm goin' to make you the best offer you ever had and take my loss on him if it's a deal. If you want to give me fifty to boot, you can throw your harness on him."

"He looks as if he might suit me," allowed the Peddler, "but as I said before I wouldn't care to buy him an' give ye my hoss. Ten dollars is about the difference. If you can sec it that way, we'll be able to do business."

"That hoss," Holman stated positively, "is worth one-twenty-five of any man's money just as he stands, an' that nag of yours might fetch thirty at auction. I'm keepin' him at a loss, though, and on a cash deal I might cut the difference to get rid of him. Gimme twenty-five and he's your'n."

"Give ye fifteen," said the Peddler.

"Tell ye just what I'll do with ye," offered the dealer. "I've had that little hoss around here for a month eatin' his head off, and there ain't much call for a critter of his size any more. I'll just split the difference with ye and that's the best cent that I'll do. Take him at that 'r leave him."

"It's a deal," the Peddler agreed. "Jerome, just help me change this here harness and I'll cash up and be goin'."

As the Peddler with his most recent

acquisition in horseflesh clattered down the driveway and made the turn into the village street, he swung half around to look back, exactly as the old dealer had calculated from a lifetime's experience with "swapping" humanity. Holman raised his hand, and the departing teamster brought his rig to a standstill.

"If that hoss," said Old Man Holman, "if that little hoss should happen to go kind o' bad in his wind after a spell, a half-ounce of Fowler's solution of arsenic in his feed three times a day for a week will help him a lot!"

"Uh-huh," replied the Peddler. "I sort o' suspected that he had the wheezes a trifle, but I'm used to them difficulties. The one I let you have got so that I couldn't get him up a hill at all, an' I've been starvin' an' dopin' him for two weeks to get him in shape to swap off. 'Bout all that'll help him, temporary 'r permanent, is the busy end of a smoothbore scatter-gun. S'long, Rufus."

The tincart rattled on the highroad and Holman sighed deeply as he dropped into his rickety chair in the shade of the barn. "Had my mind set on the heavens in my own hoss," he muttered, "so 't I never thought of 'em in his critter. Dodblast the old skinner, I might 'a' knowed the devil would be to pay the minute I see him turn into the driveway!"

## How to Feed and Water

(Continued from Page 20)

think most of the poultry professors figure about 36 lineal feet of hopper space per 100 birds. This would be three six-foot feeders where the birds can eat from on both sides. The feeder wants to be deep enough so that you can put 2" to 3" of mash in the bottom and yet have it so that they can't hook it over the edges. It wants to have a reel so the birds can't get in the hopper and scratch the feed out or lay eggs in it. The reel wants to be built so that it spins enough to discourage the birds from sleeping on it at night.

We have been making the treads on our hoppers for White Leghorns so they only have to jump 8" or 10" to get on the tread and from there eat out of the hopper. This kind of hopper is pretty good because it is just high enough to keep the birds from scratching straw and dirt into the feed. I think the heavies don't do quite as much scratching, and I think you can have the hopper down a little lower so they can stand on the floor and eat out of it. With this kind of arrangement I think you get better production out of the heavies because they are quite a bit lazier than the Leghorns.

I am not going to get into an argument here as to what is the best laying mash for you to buy. You will have to figure that out for yourself. It ought to run 20% to 22% protein and can be either a commercial or a batch mix or can be your home-grown ground grains mixed with a 32% supplement so you get at least 20-22% protein in the resulting mash. You should keep mash in front of them all of the time.

## Applied Psychology

If you have a hired man feeding the birds, you will usually find that he will fill the hoppers too full. I always tell the hired men if they fill the hoppers too full, the birds will waste the feed onto the floor and they will have to carry a lot more mash to the birds, so why not be just a little bit lazier and not fill the feeders so full and therefore not have to carry the feed? If you tell the hired man that you don't like to have him fill them too full because it will cost you more to feed the birds, he won't care and will keep on filling them just as full. Just as soon as you can get it through his head that he has got to carry more mash if he fills them too

full, you will have better results.

I don't know whether it is necessary to feed fleshing pellets at noon or not. We use them but sometime we are going to try not using them and see what difference there is in egg production. If you feed fleshing pellets, you can feed just what the birds will eat up in about half an hour at noon. This is usually around 3 to 7 pounds per 100 birds per day, depending on how heavily they are laying and how well they like the pellets.

In the afternoon during warm weather we feed 8 pounds of scratch grain per 100 birds per day, regardless of whether they are Leghorns or heavies. We step this up to around 10 pounds and sometimes up as high as 12 pounds per 100 birds per day during cold weather. We usually try to feed a scratch that is composed of cracked corn, wheat, barley, and oats, or most any combination of these different ingredients. You want to be sure your oats are heavy oats that the birds will eat and not waste. I don't think you should have more than one-third cracked corn or whole corn in your scratch mixture during the warm months and not more than one-half at anytime during the year. There are differences of opinion on this, I know, and if you want to feed more corn or all corn, go ahead. It's just not my idea of the way to do it.

### Restriet Grain

Don't feed a flock of laying pullets or hens all the grain they want. I realize that some well-meaning folks who really ought to know better recommend cafeteria-style grain feeding. It is a bad mistake. All of the experimental evidence that I have seen shows that when you feed scratch grain free-choice, where the birds can eat all they want, you get quite a bit lower egg production and there is just no sense in getting lower egg production when you can just as well have high egg production.

The other danger in feeding all the grain they want is that it encourages cannibalism; often brings on blowouts. If you have been feeding all the scratch the birds will eat and you are getting prolapsus or cannibalism, your damage may have already been done, but cut your grain down to 8 to 10 pounds per 100 birds daily and you will find that it will help.

### How It Works

Perhaps I should give a reason for my statement on this. One hen will eat the right amount of mash and the right amount of grain. The next hen likes the grain and will eat too much grain, even if she is laying heavily. Pretty soon she craves salt and she craves protein because she is not getting enough. It induces picking—either feather picking or picking of the flesh. Don't let anyone tell you that a hen is smart enough to govern her own diet on cafeteria-style feeding. Hens may be smart in some respects, but giving a hen all the scratch grain she wants to eat is just about like keeping a dish of candy in front of your children all of the time. Layers should have some grain. Between 8 and 12 pounds per 100 birds per day, depending on the weather, is the right amount.

To sum this up, give those good pullets about 3 square feet of floor space per bird if they are Leghorns and on towards 4 square feet if they are heavies; give them artificial lights from August 15th until May and have the lights come on about three o'clock in the morning or use all-night lights; give them all the mash they want; give them all the water they want and have it so they can get it quickly and easily; and keep the grain down to the amounts I have suggested. I think you will get good egg production.

## We want to tell YOU about E. R. Eastman's Newest and Greatest Book

# NO DRUMS

Ed Eastman's newest novel, which appeared in *American Agriculturist* in a serial that was only a condensed version of the book, will be off the presses in two weeks — December 1 — in time for Christmas giving to the men and women, and boys and girls, you want to do something just a little special for at Christmas.

This novel is one of the most revealing stories ever written about life at home during the Civil War period. It's an historical novel that rings true because much of the story is based upon the writer's own family experiences.

Ed Eastman's Dad was a Civil War veteran and Ed has set down in exciting fiction many of the tales of adventure his father told him, and also stories of the sacrifices of the women of the family during the war.

His characters—some lovable, some hateful—will hold your interest from the beginning to the end. You'll become so involved in their joys and sorrows that you'll be sorry when you reach the last page and the story is finished.

Orders for *No Drums* will be accepted now for delivery after December 1 but in plenty of time for Christmas. Orders should be sent to

# KERNELS, SCREENINGS and CHAFF

## SUNNYGABLES NOTES

By John B. Babcock

**W**HEN I first had a chance to travel in the Midwest with its broad, flat fields of corn and wheat, I often wondered how we ever made a living on the rocky hills of the Northeast. It looked like real fun to get a tractor and work in a 40-acre field with no steep slopes or rocks, without wondering whether you would tip over or ruin the machinery on those sharp stones that hide so cleverly in our fields. Finally I met a Kentucky hill farmer who had to compete with rich Ohio to his north and productive Indiana to his west.

Barely sixty miles from Ohio's best hog raising counties with their fields of neat corn was a young fellow doing "right good" on a patch of cleared land in the undeveloped countryside that was so hilly he literally had no place he could park a wagon without blocking the wheels. There wasn't even one field level enough to work a tractor. He used horses. He raised those crops he could make out on—some tobacco, which requires a lot of work on small acreage; strawberries for his wife to take care of; a little corn on the less mountainous slopes; and plenty of good grass from which he was making his main crop, milk, with a carefully developed herd. He had a freezer, modern kitchen, the cleanest, best behaved kids I ever saw, and a good car.

"Time used to be," he told me, "when folks in this part of the country condensed their grain into whiskey so their produce could be carried out. It took a lot of grain to make whiskey, so it was worth something and there wasn't the weight to handle. Me, I figure the same way with milk. I'd hate to carry enough tons of hay or bushels of corn out of these hills to pay the bills. Folks just have to raise what they can best make a living at."

This fellow's common sense in adopting a farm program that he could make a good living at impressed me. He used less expensive land and no outside help to raise grass and milk. With his low taxes, insurance and other overhead, he was netting as much as the larger, level-land farmers with their high labor bill, expensive land, and high machinery investment. It only costs us in the Northeast about half the capital to get into business that it costs the level-land corn belt farmer. And we can do things with our grass and animals that he could never afford to try without much greater returns to meet his overhead.

### Overseas Ideas

For many years Dad and I corresponded with an English farmer named Rex Paterson. Our mutual interest was grass silage and dairying. Recently Mr. Paterson visited Sunnygables and talked at length to Jack Conner and me. Where we Americans have the opportunity of going by the findings of our State Experimental Colleges, Mr. Paterson for the most part relies on a very carefully kept record of facts that he has accumulated himself. First off, he relieved our minds about this winter's main roughage supply—long grass silage.

Though the silo had not yet been

opened, our British friend had no qualms about whether we would have good feed or not. He has put up nothing but long grass silage for years, and after our description of how we went about it, he mentioned some fine points he would improve on, but was sure that we would have a lot of very excellent feed. The silo is opened now, and shows that Mr. Paterson was right. After we are back into the new feed a little farther, I'll report more on the quality. At least we are breathing easy now.

As we questioned Rex hungrily about making long grass silage, he brought out some interesting points. It is early to think about making grass silage, but we have planned too late so often that I'll pass on his thoughts.

### Short Stuff

Where we consider 10 or 12 tons of silage per acre nothing extraordinary, the British think in yields of three tons of green stuff to the acre. Photos of the grass stands prove that they are as productive as ours, so the only conclusion is that they cut much earlier. Jack has set his Irish chin and vows that he will start May 15th, which is earlier than we have ever gone at it before. Of course, with such young growth we will have to wilt some, and on this point Mr. Paterson says that they do not put in wet material because it makes a cold, soggy silage that is hard to remove. Indeed, they even mix straw with the grass if it seems too wet. After burning our

fingers with silage put in so dry it would not pack and keep, we will still lean toward the wet side, but are keeping in mind that soggy silage may not ferment as nicely as the wilted material.

Of course Mr. Paterson was speaking of very young grass, and the stage of growth has a lot to do with wilt. The mature "hay" we have put in too dry never had the high moisture in the first place. We were warned not to consider wilting where the forage is mature—and by mature, he meant headed out in the case of grass, or blossomed in the case of legumes.

### COLD WEATHER AND MOTORS

Whenever a farmer is wakened by a driving rain in the middle of the night, he usually lies open-eyed to review in his mind what might be hurt by the rain. After he recalls that there is no hay out, that the boys remembered to slack the canvasses and cover the combine, or that the pullets were closed in the range houses, then he can roll over and go back to sleep. The same feeling is experienced on waking up with too few blankets on a late fall night. Before the comfort of an extra blanket is sought, every farm engine on the farm flashes across the mind. Are they all drained or protected with anti-freeze?

Many tractors require that drain petcocks on both the radiator and block be opened. And some fellows maintain that it is a good precaution to turn the motor over once or twice after draining to be sure every drop has a chance to get out. In any event, there are always one or two engines that are so little used that they may be forgotten over the first sharp freeze. I can remember ruining four or five engines by such neglect. And what makes you feel worse than just plain forgetting is to gamble that the frost won't be heavy enough to harm a motor.

### Anti-Freeze

Of course the safe precaution is to fill all farm engines with permanent anti-freeze. This runs into money. On

the other hand, the less expensive, temporary anti-freeze compounds boil off or evaporate. Where an engine is only turned up once a month or so during the winter, it just doesn't seem worth the investment. Draining does protect the motor—and another wise precaution is to remove batteries from little used power plants.

Probably the biggest mistake we have made with permanent anti-freeze is to lose it through small leaks. Anti-freeze seems to find its way through bad connections or old hoses easier than water. It will even find sand holes in a cast block that never showed up when plain water was used.

While I am admitting mistakes at winter motor care, there is one that is worse than forgetting to drain an engine. That is to start up a tractor with no water in it and run it till it gets so hot that it will fire even with the ignition shut off.

### Silage Odor

This is the season when the housewife starts raising the dickens about the men coming in with that strong silage smell on their clothes. Of course the man of the house could sleep in the barn, but there are other sensible and workable solutions.

First, wool clothes absorb and hold grass silage odor more than cotton. We need to wear wool in a cold barn, but a set of coveralls which doesn't contain wool can be worn over other clothing. If wool is worn, the best advice is to remove the outside layer before going in the house.

The offensive smell of silage comes from deterioration. This can be proved by picking up a handful of material freshly dug from the silo. It has a pleasant, sweet odor. Exposure to air starts the deterioration process. Much of the odor around the barn can be eliminated by sweeping out feed bunks, keeping the silo chute clear by frequent complete cleanout, and preventing silage from being tracked around the feed and work alleys. There is no use blaming the silage for what may just be sloppy barn keeping.

Now You See It . . . . . Now You Don't!

**R**ENOVATION of poor natural grass pastures is often a costly or impossible job on some of our worst hills around Inlet Valley. We try to get what we can out of them by providing plenty of acreage per head and plan that growth will come on pretty late in the spring.

One delay in getting early spring growth is that new grass has to push its way up through the mat of dead material. Often the pastures cannot be clipped because of stones, general roughness or brush. Then, too, we hate to clip them when raking is impossible and the mowed material will seriously delay recovery of new growth.

One possible solution is this shredder which Jack borrowed for use this fall. He was able to clear pastures of brush, brambles, dead grass and weeds. Since the material is completely pulverized by some 17,000 hammer blows a minute, it lies as a fine mulch and allows

spring growth to show itself much earlier. These photos show the effect of the shredder on a heavy thorn bush, and indicate the rough patches which Jack was able to recover for pasture.

The shredder was originally designed for pulverizing corn stalks previous to disking or plowing, but may have a future in the Northeast to clip pastures, de-vine potatoes, and mulch garden residue. Where used on brush, stumps may remain, but are so frayed that there is not the danger of tire punctures sometimes experienced after mowing or cutting brush. Little power is required, but acreage covered per day is far less than with a mower. There is some doubt that present models will handle very heavy stands of lush, green material. Shredding in the fall, though, may put an abandoned pasture back into production and justify an application of lime and fertilizer to send it on its way toward real feed output.

## Save Money On This Home Mixed Cough Syrup

Big Saving. No Cooking. So Easy.

You'll be surprised how quickly and easily you can relieve coughs due to colds, when you try this splendid recipe. It gives you about four times as much cough medicine for your money, and you'll find it truly wonderful for real relief.

Make a syrup with 2 cups of granulated sugar and one cup of water. No cooking needed. (Or you can use corn syrup or liquid honey, instead of sugar syrup.) Then put 2½ ounces of Pinex (obtained from any druggist) in a pint bottle, and fill up with your syrup. This makes a full pint of medicine that will please you by its quick action. It never spoils, and tastes fine—children love it.

This simple mixture takes right hold of a cough. It loosens the phlegm, soothes the irritated membranes, quickly eases soreness and difficult breathing.

Pinex is a special compound of proven ingredients, in concentrated form, well-known for its quick action in coughs and bronchial irritations. Money refunded if it doesn't please you in every way.

# Liability Insurance for Farmers

By G. W. HEDLUND

THERE are several types of liability insurance that farmers can buy to protect themselves and their families. The major kind are:

**1. Automobile and Truck Liability Insurance** protects the owner from liability resulting from damage to property or injury to people. Most vehicle owners carry this type of insurance because of the risks involved. It is not mandatory under New York State law until one has had an accident. The terms 5-10-5 or 10-20-10 are often used in connection with the amount of coverage. The first figure indicates that the insured is protected up to that number of thousands of dollars in case of injury to one person. The second figure refers to the maximum coverage in case of injury to two or more persons, and the last refers to maximum coverage for damage to property. As prices have risen, many persons have increased their coverage.

This type of insurance can and usually is combined with medical payment; fire, theft, etc.; and collision insurance. It is probably the most necessary kind of liability insurance for farmers to have.

**2. Public Liability Insurance** protects the farmer in case of lawsuits against him by the general public resulting from accidents in which he might be liable. For example, it protects a farmer against suit over injury caused by his dog or other animals, as well as personal acts of the farmer or members of his family while on or off the farm. For an extra payment, the insurance can include liability in connection with business activities of the farmer or to household employees. An employer's liability policy protects the farmer from lawsuits resulting from work accidents to hired help.

**3. Employer's Liability Insurance** protects the farmer in case of a suit by an employee who is injured while at work. From the standpoint of the farmer, such insurance provides protection about equal to that provided by

workmen's compensation insurance, except that it does not provide payments to the injured employee unless the farmer can be proved negligent. In other words, the farmer is protected from suit by his hired help. The hired help can collect only if the farmer can be proved to be negligent. The employee cannot collect if he was negligent. This type of insurance is often purchased in combination with public liability insurance.

**4. Workmen's Compensation Insurance** assures the employee that he will receive certain payments in case he is injured regardless of who was negligent, if he agrees not to sue his employer. It protects the farmer from suit and, in addition, provides payments to injured employees even though the farmer is not negligent. In New York State such insurance is not mandatory for farmers. It can be obtained either from the State or from private insurance companies. If a farmer wishes to protect himself from suit by employees, he should have either workmen's compensation or employer's liability insurance, but not both. Decisions as between the two should be based on the protection desired and the comparative rates. The rates of both are usually based on the payroll, subject to a minimum charge.

Other types of liability insurance are available, such as tractor liability and liability for injury caused by consumption of farm products sold by a farmer. None of the above protect against injury to the farmer or his family but apply only to liability to others. Bear in mind that the above discussion is general in nature and may not apply to any particular policy. Many companies offer various combinations of protection which can be selected according to a farmer's particular needs. The best way to understand liability insurance in all its ramifications is to consult a reliable insurance man. (Clip and save this item for future reference).

## SERVICE BUREAU

### HE DIDN'T GET AWAY WITH IT

BACK in August, we had a letter from Harold Potter, Route 2, Springville, N. Y., an AMERICAN AGRICULTURIST subscriber in need of help. A motorist had struck some of his cows while they were being herded across the highway. The driver admitted he was at fault, and agreed to pay for any damage done. One of the cows had to be slaughtered, and Mr. Potter wrote the driver about it. The letter was returned by the Post Office, who advised that there was no Robert Jones at the address shown in Niagara Falls.

Mr. Potter had obtained the license plate numbers and sent them to us. We checked with the Pennsylvania Bureau of Motor Vehicles, and were told that those plates had been issued to Melvin Maines, Williamsport, Pa. The Service Bureau next contacted the Pennsylvania State Police. They checked and found that Maines had left his home in July and had not been seen after that. However, they did send us the address of his father in Niagara Falls.

Up until that time, we had no assurance that our subscriber had taken the license numbers down correctly; but the combination of the phony address in Niagara Falls and a father living there was convincing.

Our next step was to report the whole matter to the New York State Police. With their usual promptness,

they went to work on this case. About three weeks after we had written them, we had word that Maines had been arrested and charged with leaving the scene of an accident and injury to a domestic animal. He was fined \$10 and ordered to make restitution to Mr. Potter in the amount of \$50. The Troopers had located him, asked Mr. Potter to swear out a warrant, and picked him up as soon as the warrant was in force.

\* \* \*

### ROOFS AGAIN

An elderly man and his son painted my tin roof a couple of years ago. They guaranteed the job for ten years, but the roof began to leak after the first rain. I wrote the Rice Paint Co. in Cleveland at the address given me by the fellows who did the work. The letter was returned by the Post Office marked "No such street number."

We checked with the Cleveland Better Business Bureau, and were told that they knew nothing of the Rice Paint Co. nor could they find them listed in the telephone book. It looks as though these painters gave a fictitious company name and address.

This is just one more example of why it is wise to have home improvements done by local concerns. Then if something goes wrong with the job, you stand a pretty good chance of getting a satisfactory adjustment. Lots of times a person thinks he is saving money by dealing with cut-rate outfits, only to find that he is stuck with inferior workmanship and materials.

When you get a

# Proof of Super-Traction

**Super-Sure-Grip is America's best-liked, most-wanted tractor tire!**

In all America, no tractor tire can compare in traction and wear with Super-Sure-Grip. Because no other tire gives you **ALL THREE** Extra-Traction Features—and at no extra cost. Three vital features that insure not only *extra traction*, but *extra-long wear* and *extra value* through the years ahead.

Here they are—the three Extra-Traction Features that make Super-Sure-Grip America's *First Choice* tractor tire!

## ① Goodyear's Sure-Grip Action

Goodyear lugs are set closer together at the shoulder than center. This exclusive design provides a vise-like grip that holds the soil in the ground, gives the lugs greater traction than curved lugs that "plow out" the soil. Result — Goodyears pull where other tires won't!

## ② Straight-Bar Lugs

Because Goodyear lugs are set straight, they have greater traction area than lugs that toe in. Result — Goodyear lugs thrust against the soil with equal force from center to shoulder, giving better traction backwards and forwards — "the greatest pull on earth!"

## ③ Extra-Long Wear

Since Goodyear's Sure-Grip lug action holds the soil firmly in the ground, skid, slippage and abrasion are greatly reduced. Goodyear's famous O-P-E-N C-E-N-T-E-R self-cleaning lugs have no mud-catching hooks. The result is smoother riding, less slip, far longer life!

## JOIN US IN THIS FIGHT FOR AMERICA

THIS Forum Issue of AMERICAN AGRICULTURIST, devoted to saving free enterprise, our liberties and our way of life, is the most important issue we have ever published. If you study it carefully you will have a complete summary of where America stands in freedom's cause in this Year of our Lord, Nineteen hundred and fifty-one. You will note that its articles are written by many of the greatest living Americans, men like Herbert Hoover, Jim Farley, General MacArthur, Senator Byrd, Allan Kline, President of the American Farm Bureau Federation, Deane Malott, President of Cornell University, and by dozens of men and women readers. I earnestly suggest:

1. That you save this issue carefully, read it, and re-read it.

2. That you use it as a basis of discussion programs in your meetings, and that you follow in those programs the actions suggested in these articles. Remember that we have been drifting rapidly down the road to socialism and statism for more than 20 years. It can be stopped if enough people want it stopped. But remember that we won't be able to win the battle today or this year. It must be a continuing battle in which we all need to stand up and be counted.

3. If you have a friend or friends who in your opinion need to read articles like those in this issue, send us their names and addresses and we will send them a sample copy free of charge. Better still, enclose \$1 for a two year's subscription to AMERICAN AGRICULTURIST for some friend who ought to be reading this publication, which is right out in the front all of the time fighting your battles.

## PRIZES FOR BEST FOOD PRODUCTION

RURAL Radio Network, owned and operated by leading New York State farm organizations, is announcing a most interesting and worthwhile contest to find the best food producers in each rural county in the Rural Radio Network listening area.

The purpose of the award is to recognize top food producers, because high production is the basis of the American system of a more abundant life. The top farmer in each county will receive a Zenith Super Triumph FM-AM table radio. The next highest men in each county will receive \$15 credit to apply on Zenith radios of their choice. Other prizes include county food production award certificates suitable for framing. The awards will be made on Wednesday, March 19, 1952, during the Farm and Home Week at Cornell.

To compete, you must obtain an application blank before January 15, 1952. Application blanks will be mailed on December 26, 1951, to as complete a mailing list as is available in the county, but if you do not receive one, write to Rural Radio Network, Ithaca, New York, for a copy. The award will be made on the basis of output units per man. Whether or not you win recognition, this analysis of your farm business will be interesting to you and may help you make more money.

## YOU COULD BE NEXT

DID you know that farming is one of the most dangerous of all occupations? And in spite of all the warnings, we are doing little to decrease the number of farm folks injured or killed. From 1940 to 1950, accidental deaths in non-farming decreased one-third, while accidental deaths with farmers increased one-fifth. A farm worker is three times as likely to be killed at work as is a worker in a manufacturing plant.

With the labor shortage as it is, it is tragic for a farmer to be laid up by accident even for a short time, for on most farms there is absolutely no one else to carry on the work. Almost every time I pick

*By E. R. Eastman*

up a newspaper I read an account of some farmer—often someone I know—who has been killed or injured on the farm by an accident, usually caused by his own carelessness.

We operate a lot of dangerous machinery, we frequently have to take care of dangerous animals. Familiarity breeds contempt and we grow careless. There is no use repeating the rules of safety. You know what they are. Won't you try to be more careful, if not for your own sake, for that of your family? You could be the next one killed or hurt, you know!

## CONGRATULATIONS TO POTATO GROWERS!

FOR years, even at the loss of some friends, we of AMERICAN AGRICULTURIST urged potato growers to get out from under government controls and subsidies and produce potatoes for consumers instead of for the government. Finally, to their everlasting credit, potato growers did throw off the chains of regimentation and of government "give-me's" and started managing their own business again by operating under the law of supply and demand in a free market.

What happened? Potato farmers are now enjoying nearly 64% increase in "spud" prices. Wholesale prices of potatoes in some parts of the country have more than doubled, and in spite of this increase, prices have only gone up about 37% to consumers.

All of this has happened since Congress in 1950 said "No more subsidies to potato producers." It is another striking example of how wrong the government economists can be and how right and courageous farmers can be when they adjust their crop production to consumer demand free of restrictions and controls from Washington. How interesting indeed it is that after years of a market glutted by potatoes and of constant criticism because of tax-supported subsidies, now for the first time in many years the government is asking the growers to produce more potatoes.

## DO YOU HAVE ALLERGY?

DOCTORS estimate that 10% of the general population have some major form of allergy, and another 50% have minor symptoms.

Allergy is a condition whereby a person is unusually sensitive to some substance which is harmless to most other people. There are many substances which may cause allergy, including many different foods, pollen, the hair or fur of animals, and dust, particularly house dust. The allergy may affect the skin, causing an eruption, itching or burning like hives or eczema, the eyes, the joints, the intestinal tract, and the organs of breathing as in asthma. Frequent and prolonged sneezing is one common symptom of allergy caused by pollen or dust.

The first step in controlling allergy is to consult your doctor, who will help you to find and eliminate the offending causes, or take steps to make you less sensitive to them.

## SOUND AND RIGHT!

FARMERS certainly have a right to be proud of the sound and courageous stand taken by their farm organizations against domination of agriculture by the Federal government. Both the Grange and the Farm Bureau are against that part of the PMA program which pays direct aid to farmers in the form of subsidy on lime and superphosphate. The New York State Grange disapproved in no uncertain terms the Family Farm Policy Review as a

method of obtaining farm opinion, stating that each agency should stand on its own feet without blanket approval.

The Grange also states that it is against any plan that puts farmers and consumers at the mercy of government officials at public expense.

Equally strong is the opposition of the New York State Federation of Farm Bureaus and the American Farm Bureau Federation to the wrong kind of or too much government control in agriculture. Many other general farm organizations and many farmers' cooperatives, including the G.L.F. and the Dairymen's League Cooperative Association, are in emphatic agreement with the New York State Farm Bureau Federation when it puts its finger on the constructive key to this whole problem of too much government by a resolution which reads:

"Research and education should be the principal help of government to farmers."

The Farm Bureau Federation certainly spoke the truth, also, when it said:

"Farmer-controlled and farmer-organized groups should be the sole spokesmen for agriculture."

There is only one thing more that needs to be said. Join your Grange, your Farm Bureau, your Home Bureau, and other farmer-controlled organizations and cooperatives. They are your best hope for a successful farm and a happy farm home.

## CORN IN GREAT DEMAND

THE CORN crop this year, while large as compared to former years, is still not up to expectations and is far short of the 4 billion bushels needed to take the pressure off cattle and poultry feeders. With meat prices where they are, it will take some doing to pry enough corn away from the cattle and hog feeders of the West to meet the demands of eastern poultry and dairy feeders.

Eastern dairymen have done much to handle this problem by such practices as more grass silage, more and better legumes, improved pastures, and by growing home-grown grain. The heavy demand for corn and other grains, which will no doubt continue for years, increases the necessity for every dairyman to plan and work to make himself more independent by using the above methods.

## READ GEORGE DUFF'S STORIES

YOU are missing a bet if you are not reading the short stories by George Duff (Page 50). While these stories are in a series, each is complete in itself. They were written right out of the lives of the kind of people you have always known. They'll make you laugh, and they'll make you think.

## EASTMAN'S CHESTNUT

This story is making the rounds in Britain:

An agitator was addressing a crowd of workingmen. "Come the era of the common man," he said, "and you will enjoy the pleasures of the rich. You will walk down Park Lane wearing a top hat . . ."

"Excuse me," interrupted a member of his audience, "but Hi'd rather 'ave a cloth cap."

" . . . or if you prefer it, a cloth cap," went on the speaker. "You'll wear a cutaway coat and pinstripe trousers . . ."

"Excuse me," interposed the interrupter again, "but Hi'm more comfortable in corduroys."

"Very well, corduroys if you insist," continued the annoyed orator. "And you'll ride to work in a Rolls Royce . . ."

"Excuse me," said the cockney, "but Hi'd rather usc me bike."

The agitator left his platform, grabbed the man by the sleeve and shook him roughly. "Listen, you!" he said between his teeth, "come the era of the common man and you'll do bloody well what you're ordered to do!"

## Are We NUMB to Regimentation ?

By  
**DEANE W. MALOTT**  
*President, Cornell University*

Business men welcome it, especially in the face of possible depression; too many workmen seek it if it will make labor a scarce commodity.

What the American people must come to realize is that the incentives of private enterprise do not and cannot flourish under government enterprise. The Civil Service cannot grade men for loyalty, vision, integrity or teamwork; it leaves little to hope and ambition. Ability and above-average performance do not necessarily hasten a civil servant's progress, while below-average performance can scarcely hold him back.

Clearly, too many Americans are calling on Washington to do for them what our forefathers would have done most willingly for themselves. Long-founded concepts of initiative and thrift and integrity are heading toward extinction. Government, like a strait jacket, is bending itself around more and more aspects of our lives.

America urgently needs a new thinking which proclaims that government be not an end in itself but instead a servant of free enterprise, an expeditor for the industry and energy of a free people. Otherwise an unseen paralysis sweeps over the nation and we sink slowly from the free republic of decentralized government, to the welfare state, to the police state. Over and over again in the history of man this cycle has repeated itself.

The administration appeals for ever bigger taxes to underwrite its sprawling activities. Already, with hidden taxes included, the tax tag on an automobile accounts for nearly half its cost, and taxes build up \$2 of a \$4 telephone bill.

The huge tax burden is a millstone which in times of heavy spending can be supported. But in serious recession, the clamor for more government programs of relief and aid will swell, and the costs of government will mount. Then if the tax burden becomes too great, a panicky swing to government control and operation is inevitable and freedom recedes under the hue and cry of emergency.

We must not put our faith in government paternalism lest we shall perish, strutting to our doom as has many a civilization before us.

### THE FOUNDATIONS OF MORALITY

**A** LONG time ago a man with considerable wisdom penned the following: "The foundations of morality are like all other foundations: if you dig about them too much, the superstructure will come tumbling down."

As I've traveled back and forth across the country on speaking engagements in recent months, many anxious people have asked the question: "What is happening to the morality of our country?"

It is heartening to find such anxiety being expressed in many sections of the nation, for its presence suggests that in the main our American society still is wholesome. It also suggests that those in public and private life who choose to disregard a code of ethics based on high moral principles may not continue endlessly to enjoy public respect and personal good fortune. However, until this anxiety becomes more widespread and provokes remedial action there exists a very clear threat to the whole moral structure of our nation.

—Dr. George S. Benson.

# Concerning HONOR

## In Public Life

**I**N VIEW of our serious national situation I would like to review a few things for you to think about. They are mainly related to honor in public life. Let me say at once that honor is not the exclusive property of any political party.

I start with the idea that all things in government which bear the prefix "New" are not necessarily new. We have overworked this word "New" in trying to get out of this age of misery from our 37 years of hot and cold wars, with intervals of hot and cold peace. In this period we have either been cured or made over "New" about 14 times. We have had the New Order, the New Freedom, the New Day, the New Era, the New Outlook, the New Epoch, the New Economy, the New Dawn, the New Deal, the New Religion, the New Liberalism, the New War and several New Foreign Policies. None of these were really "new" discoveries.

And the New Testament is too often omitted. After each "New" we have a relapse and take another pill, labeled "New."

### Unreliable Signposts

Some of these somethings "new" have value, but too many have been false signposts on the road of national progress. Some point to will-o'-wisp of security not to be had on this earth. Some lead the nation over the precipice of inflation and socialism. Some just lead to the land of make-believe. Certainly some of them are tainted with untruth.

I suggest we adjourn trying to make America over into some other shape until we get out of this cold or hot war. Our present crisis is dangerous enough to require one concentrated undeviating purpose in Washington.

There will be plenty of time to exercise our muscles on "new" experiments after these violent changes in international temperature are survived. And these programs of making America over add an especially destructive New—that is New Taxes.

Think about it.

### "Old" Things Have Value

The practical thing we can do if we really want to make the world over again is to try out the word "Old" for a while. There are some Old things that made this country.

There is the old virtue of religious faith.

There are the old virtues of integrity and the whole truth.

There is the old virtue of incorruptible service and honor in public office.

There are the old virtues of economy in government, of self-reliance, thrift and individual liberty.

There are the old virtues of patriotism, real love of country and willingness to sacrifice for it.

These "Old" ideas are very inexpensive. They even would help win hot and cold wars. Some of these Old things are slipping badly in American life. And if they slip too far, the lights will go out of America, even if we win these cold and hot wars.

Think about it.

We might explore some of the things that have happened to the Old virtues of integrity, truth, and honor in public life. During the recent past we have

had a flood of exposures by Congressional committees, by State Legislatures, by Grand Juries in scores of cities and the press.

More than 175 years ago, the 56 members of the Continental Congress of the United States unanimously declared a program of action and certain principles of American life. The concluding words of the Declaration are a pledge of "our sacred Honor."

I sometimes wonder what the 56 Founding Fathers, from their invisible presence in our Congressional Halls, would say about the procession of men in responsible position who have come before its committees of this day. What would they have thought of the "sacred Honor" of the five percenters, mink coats, deep freezers and free hotel bills?

But I am less concerned at stealing public money than with the far more destructive forms of dishonor. What would the Founding Fathers have thought of those who coquette with traitorship? Or of secret and disastrous commitments of our nation which were denied at the time? Or high officials under oath contradicting each other as to facts? Or the failure to keep promises to the people? Our civilization moves forward on promises that are kept.

We thus have a cancerous growth of intellectual dishonesty in public life

which is mostly beyond the law. One of its chief instruments is corrupt propaganda. The mildest form of corrupt propaganda is a process of persuasive part-truths. At times it even rises to the high moral levels of selling snake oil. But the malignant form of propaganda spreads deadly poisons. Its process is to create suspicion, hate and fear. Its purpose is less to persuade than to conceal truth and to crush opposition.

It is difficult enough to debate against the gadgets of propaganda. But there is something worse. That is the concealment of truth and commitments. For example, certain secret commitments were entered into

at Teheran and Yalta which sold the freedom of half a billion people down the river. They were not disclosed to the Congress or to the American people. Does anyone believe that had they been submitted to the American people for debate and to the Congress for decision, they would ever have been approved? That is where we lost the peace and wandered into the land of hot and cold wars.

Debate founded on the full disclosure of the whole truth and free of these gadgets is the stuff that can save free men. Think about it.

I would like to explore this Old virtue of truth, integrity and honor in public life a little further.

Congress can well widen the laws so as to clutch the New kinds of bribes and benefits they have discovered. But Congress cannot reach intellectual dishonors.

Part truth, concealment of public commitments, propaganda and its gadgets and failure to enforce the laws are but part of them. And there are group pressures "to get theirs" which smell from both the decay of integrity and the rotting of patriotism. And some persons arrive at their morals with a divining rod that measures morals in terms of votes.

Might I suggest that there are already some old and tested codes of ethics? There are the Ten Commandments, the Sermon On The Mount, and the rules of the game which we learned at our mother's knee.

Can a nation live if these are not the guides of public life?

Think it over.

### Our Right to Complain

The American people have a right to bitter complaint over these disclosures of dishonor in high places. The duty of public men in this Republic is to lead in standards of integrity—both in mind and money.

Dishonor in public life has a double poison. When people are dishonorable in private business, they injure only those with whom they deal or their own chances in the next world. But when there is a lack of honor in Government, the morals of the whole people are poisoned.

The drip of such poisons may have nothing to do with dishonor in some college athletics or the occasional policemen on the beat. But the rules of the game have been loosened somewhere.

Some folks seem to think these are necessary evils in a free government. Or that it is smart politics. Those are deadly sleeping pills. No public man can be just a little crooked. There is no such thing as a no-man's-land between honesty and dishonesty. Our strength is not in politics, prices, or production, or price controls. Our strength lies in spiritual concepts. It lies in public sensitivity to evil.

Much as the Congress has my good wishes, something stronger than a new code of ethics is needed by America. The issue is decency in public life against indecency.

Our greatest danger is not from invasion by foreign armies. Our dangers are that we may commit suicide from within by complaisance with evil. Or by public tolerance of scandalous behavior. Or by cynical acceptance of dishonor. These evils have defeated nations many times in human history.

The redemption of mankind by America will depend upon our ability to cope with these evils right here at home.

Think about it.

### Conclusion

But I do not wish to leave you with any implication of pessimism. I speak to you of some of our weaknesses, not because of frustration or despair, but to urge remedy. The fact that we are vigorously washing our dirty linen in the open is a sign that moral stamina still survives.

Without bitterness in our hearts, we are raising our eyes to the Creator of man who assured us that in American soil we can find the moral and spiritual forces which make free men and women. In His guidance, we shall find the fortitude to correct our errors to straighten our courses, to resurrect the spirit that made our America so free and bountiful a nation.

Herbert Hoover

By  
**HERBERT HOOVER**

### Just An Appetizer

—Syracuse Post Standard

# Miracles Made to Order...

## a Promise Only Free Men Can Fulfill

● In the beginning America was promises. Then it was promises and fulfillments. And free men, excited to action by dreams of achievement, saw their dreams grow to realization in the unfettered opportunity of a free economy.

In America's free economic climate, men flourished. They worked miracles . . . made the U.S. the one land where the promises which lay buried in the spirit were fulfilled day by day. Witness our achievements in agriculture . . . the miracles wrought in but a single century. Americans took the backache out of farming . . . sent the flail to the museum . . . put the combine in the field.

Over the past 110 years, the business begun by Jerome I. Case has had a part in this miraculous agricultural advance. We of today know that our success story could never have been written except for the liberties all Americans have enjoyed since adoption of the Constitution. We know, too, that those liberties are in danger today. We heartily endorse the joining of business and agriculture in this modern crusade to safeguard our personal liberties!

*In the days of the sickle and flail this storm-flattened crop of oats, heavy with grain on four-foot straw and overgrown with weeds, would have been a total loss. But the miracle of modern farm machinery, exemplified here by the Case 9-foot Self-Propelled Combine on the farm of J. R. Masters near Marcellus, N. Y., saved nearly all the grain. This is but one example of the multitudinous ways in which better machines, developed by free men, reduce loss and boost production.*

**J. I. CASE CO., RACINE, WISCONSIN**

**SERVING AGRICULTURE SINCE 1842**

# FREEDOM Is Your BUSINESS

BY E. R. EASTMAN

**A** MERICANS are the richest people in the world, and the richest people in all history. Mind you, I did not say that this was the richest country; I said people. The average citizen of America is far richer in actual material comforts than any king of olden times.

We own 95% of the refrigerators in the world (Russia owns practically none.)

We own 90% of the bathtubs.

We own eight out of every ten automobiles in the world.

We own forty million telephones, which is two-thirds of all the telephones in the world.

Forty-five million of our people have savings deposits, and these deposits exceed those of all the countries of Europe, whose combined population is four times that of ours.

We own 70% of all the life insurance in the world, which is another form of savings.

87 million of our citizens own 49 billion dollars worth of savings bonds.

How did we get to be the richest people in the world? There must be some great basic cause. It was because of our system of free enterprise, because the individual American has had the liberty and freedom to make the most of his opportunities just so long as he did not trample upon the liberties of his fellow citizens. We got that way because in this America of ours we have had:

- Freedom to worship
- Freedom to vote
- Freedom of speech
- Freedom to travel
- Freedom to work
- Freedom to do business
- Freedom to organize

Why, oh why, therefore, are there so many, many who would sell or give away this great birthright of freedom? Why will they throw out of the window the freedoms and the way of life that have meant so much to so many succeeding generations of Americans, and which are so much better than any other country has ever enjoyed?

Why, I ask, are we losing these freedoms? It is because great masses of our people have been sold on the false philosophy of the "give-me's", something-for-nothing. It is because the people themselves, and therefore their representatives, have tried to find substitutes for the basic principles of thrift, hard work, personal initiative, and just good old-fashioned honesty. Because we have followed these false leaders and schemes, many of our freedoms have now been restricted, and are on the road to being destroyed. We are rapidly losing our liberties. If you don't believe this, consider the following facts:

## Americans are Being Regimented

One out of every 10 workers in the United States is on the local, state or national government payroll.

There are now 1,816 Federal government agencies, departments, bureaus, divisions and sections, employing more than 2 million people at an annual payroll cost of more than 8 billion dollars.

The Federal payroll as of last

summer was increasing by the addition of nearly 1,000 workers per day. The Federal government hired five times as many new employees in June, 1951, as it did in May.

There are now more government workers than all of the hired help on the farms in the United States.

With this great horde of government workers, there is tremendous duplication and confusion. In many government departments the sick leave and vacation time can add up to more leave with full pay than any independent business can afford to give.

Many government workers, however, do not avail themselves of all

place, trouble breaks over the dam somewhere else, requiring new regulations and new controls *ad infinitum*. The necessity of reading, trying to interpret and follow government regulations on price control alone is a stranglehold of regimentation even on small businesses, and doubly so on all other business and on agriculture.

## Government Extravagance

No patriotic American can conscientiously object to government spending for defense if the money is spent wisely. But if the country is to be saved from financial ruin, we must object to the billions that are being

would business last operating that way? The State Department has at times served lunches to visiting foreign students and the officials who entertained them at a cost of \$8.73 per person. In one order the Army bought for its 1½ million men some 68 million can openers, over 4½ billion pairs web belts, nearly 12 billion pairs of boots, and 60 million gallons of paint.

One government official reports that out of 65 billion in terminated war contracts, nearly a billion dollars of fraud and over-payment was involved. The Maritime Commission could not account for millions of dollars; they don't know what it was spent for. The Department of the Interior's yearly spending has increased 696% in 10 years. The Reader's Digest tells of hundreds of Federal employees whose only job was to make out purchase orders. The average "work load" was two orders per worker per day. A large percentage of the purchases were for less than \$20. The cost of putting through each purchasing order averaged, in the Treasury Department, for example, \$7.06, in the U. S. Coast-guard, \$23.94.

A Congressional committee investigating employee utilization found that in order to give the appearance that they had work to do, employees were forced to falsify records by signing erroneous work progress reports. An employee testified that "there was not enough work to keep more than one-third of us busy at any time. Supervisors sat and talked all day. I was told to write personal letters, just to appear busy."

A government-backed 111 million dollar public housing development is under way in Los Angeles, where 2,000 vacant apartments are for rent at less than \$40 a month each. The eventual cost of the huge Arizona reclamation project will approach 3 billion dollars, to reclaim a million acres. Putting it another way, the taxpayer will put up ten times the entire value of that much good farm land.

## Bureaus Oppose Savings

It would take a book to give all of the examples of government extravagance, but the above are enough to show why taxes are becoming fantastic and ruinous. When proposals go before Congress to reduce government spending, here is what happens:

A cut was proposed in the funds for the Weather Bureau. Immediately government employees got busy sending out propaganda showing the number of weather stations that would have to be closed. This was a plain attempt to build a fire back in the country to bring pressure on Congress to make no cut. It is probable that the cut could have been made without closing any stations.

Another example of what happens when economy is proposed is the government pressure propaganda brought to maintain the subsidies for free government lime and phosphate. A farmer is told "You're a sucker if you don't get it. Your neighbors are getting it, and you're helping to pay for it." That argument obviously gives little consideration to the plain question of right and wrong.

People close to the Washington scene state that when word gets around of a proposed cut, every worker in the bureau involved gets a carefully worded suggestion that he or she may be dropped because of the cut in appropri-

How much will you give for the promise of three meals a day as long as you live, a roof over your head, clothing for your back, free medical service, and the assurance that your neighbor will never have more than you have?

The "lifer" in Sing Sing has that kind of "security," free room, board and laundry, with a haircut thrown in twice a month. Not a thing to worry about—except his freedom. Drop in some time and ask him how happy he is.

of these privileges, and of course, much government work is necessary in a country as large as ours, and many of the employees are sincere, able and hard working. But as a result of all these government agencies and bureaus, over which American citizens have no control, we are today ruled and regimented by bureaucratic regulations instead of by laws passed by our elected representatives in Congress.

Someone has truly said that every time Congress or a legislature passes a law at least a little liberty is taken from the people. If you add the thousands of laws to the hundreds of thousands of bureaucratic regulations which have the force of law, it becomes plain that agriculture, business and the American citizen himself are rapidly becoming tied hand and foot by government red tape, with consequent loss of freedom to operate and to live. The impossible job of controlling prices illustrates this point. When government interferes with the law of supply and demand in one

wasted by the Federal government on unwise or socialistic domestic policies and enterprises, and we must object to the utter lack of good business methods by the armed forces when buying supplies or hiring labor. Examples of such extravagance are almost without number. For example, consider the cost of reconditioning the Sampson Air Force base in Seneca County, New York. Following World War II the camp was left largely unguarded, with the result that much valuable property was stolen and carried away. Then, when it was suddenly decided to recondition the camp, there was almost no limit to the wages that were paid for time and overtime, and little price limit on the material that was purchased. Those familiar with conditions at the camp say that the lack of thrift or of any attempt to save the taxpayers' money was disgraceful.

It would take a book to cite other examples of government waste and extravagance. Twenty-five thousand chauffeurs are employed to drive government officials from place to place. How long

## PER CENT OF TOTAL WEALTH

## GOVERNMENT OWNERSHIP IN U.S.A.

Not counting land, the government owned more than one-fifth of the wealth of our country in 1946 (the latest figures we could find). It also owned about one-fifth of the land area. Just look at the chart (prepared from data compiled by the National Bureau of Economic Research in 1950) and see how government ownership of wealth has been shooting up under bureaucracy!

ation. Naturally many of these workers then tell their families back home to get into action and stop the reduction.

## Tax Facts and Our Liberties

No American now needs to be told what government bureaucracy and extravagance are doing to the taxes he has to pay. What most Americans yet do not realize is the effect on them of indirect taxes which are hidden in substantial amounts in everything we buy. Just to refresh your mind on this extremely dangerous tax situation, consider these facts:

**1.** Look at and study the picture in the statement on this page of Freedom on the March entitled "The Darkening Shadow." Note that the Federal expenditure alone for the current fiscal year ending June 30, 1952, will equal the estimated total income payments of all individuals in the blackened area, which is more than two-thirds of the United States.

**2.** Every child born now into this America of ours has a mortgage chained to his neck of approximately \$1,700, the same being his part of the national debt. Think of that as a handicap to the child's ability to get ahead in business or in a profession.

**3.** Remember, too, that the total Federal debt is equivalent to an \$11,000 mortgage on every owner-occupied dwelling in the United States.

**4.** In 1939, a married man with an income of \$2,500 was exempt from Federal taxation and was able to keep all of his earnings. This year, however, he is compelled to work 22 days to pay his Federal income tax. It is even higher now because of the recent hike in income taxes.

A married man with \$5,000 dollars income works 34 days for the Federal government.

In 1940, all state and local taxes amounted to 8.7 billion dollars, while Federal taxes amounted to 5.7 billions. In 1950, state and local taxes were 16.5 billions, but the Federal tax had reached 39 billions. At this rate, in ten years more Washington will be taking most of our money and giving back to us what it sees fit.

Every dollar taken by government is a dollar taken out of production.

Moreover, the tax situation is such that men with money have less and less desire to take the risk involved in business. If they win, the government gets the profits; if they lose, it's just too bad, for it's their loss. Production and more production are the only answers to economic safety and to the material welfare of every citizen.

## Government Ownership and Freedom

Government is the largest landowner in the country, with 412 million acres, or 20% of the total land area of con-

tinental United States. Huge reclamation projects now planned will add further big areas. It has a 16 billion dollar housing act insuring further government ownership of land and buildings.

Government owns and operates over 100 different business and industrial enterprises in competition with regular business, including, for example, millions of dollars worth of electric power plants. To a greater degree than even farmers realize, government controls agricultural production by quota and subsidy laws.

This socialization of private enterprise would not be quite so dangerous were the government a competent and thrifty operator. But it should be obvious to any thinking person that few politicians or bureaucrats have the ability or the experience to operate a business. Nor is there any incentive for economy when government operators can run to Congress and the taxpayer to make up their deficits.

The tentacles of government operation and control are constantly reaching out for more and more, and are a sure road to complete government dominance and eventually to communism. How Stalin must laugh when he looks at what is happening inside America! If the present situation continues, Russia needs no war to gain her ends!

## Government Scandals

Communists in frightening numbers have been discovered in low and high places in government, and in some cases when accused have been defended by other government officials. The chairman of the Democratic Party was accused of using his influence to get the RFC to loan government funds to his friends. He resigned under fire.

Perhaps the most disturbing of these government scandals are those discovered in the Internal Revenue Bureau, where high officials charged with the responsibility of collecting taxes have been stealing the taxpayers' money. Other scandals involving government officials of high and low position include bribes of deep freezers, free hotel accommodations, mink coats, etc., etc. in return for helpful influence.

The scandals are a result of:

1. The tremendous growth of government bureaucracy, with its resulting confusion and opportunity for wrong doing.
2. One party being in power too long.
3. The indifference of the American people to what is going on in their own government.

## What Can Be Done?

How often one hears someone say something like this: "I'm only one of 150 million people. What can little I do?"

The answer to that question, of course, is that there is much that you

can do. Small minorities have been responsible for starting the great religious, social and political reforms of the world. Those few founding fathers who drew up and signed the Declaration of Independence are our best example.

Fortunately, we who believe in freedom in America are still many and mighty. We just need to get aroused. Here are some of the things that you can do:

Get the facts. There are some in this article, but figures change rapidly.

For further information write to:

1. Freedom on the March, executive secretary Douglas Hewitt, 119 South Cayuga Street, Ithaca, New York.

2. The Foundation for Economic Education, Irvington-on-Hudson New York.

3. The Committee for Constitutional Government, 205 East 42nd Street, New York City.

4. The U. S. Chamber of Commerce, Washington, D. C.

There are dozens of other sources of good information.

After you have informed yourself, get your own local organizations — Grange, Farm Bureau, Home Bureau, Cooperative, Rotary, Kiwanis or Exchange clubs, Sons of the American Revolution, Daughters of the American Revolution, the American Legion, Veterans of Foreign Wars, any organization to which you belong — busy in the cause of freedom. See that speakers on freedom are on the programs of these organizations.

Both as an individual and as a member of an organization give more attention to community housekeeping. Good government begins at the grass roots. Attend your caucuses and the primaries of your party. It's too late to do much about a candidate at elec-

tion time if you have taken no part in his selection at the primaries.

Vote and help to get out the vote. It is disgraceful that only about 40% of the people exercise their right of suffrage. If you lost the vote and after it was too late most Americans would go underground to fight to get back that marvelous privilege. Why lose it in the first place?

Attend and take part in your school meetings. These meetings have many strong powers, but only a few qualified voters attend.

Know your representatives in the State Legislature and in Congress, and never hesitate to let them know your wishes. How can you blame them for actions that do not suit you if they don't know how you feel?

Talk and fight with your friends and in your organizations against the rapid increase of statism and socialism. Campaign against government waste, extravagance and high taxes. On this point, is your own house in order, or do you belong to the great army of "give-me's" taking government hand-outs?

Resist the trend toward socialism in every legal way possible. Right in your county are dozens of Federal government workers. Are they all necessary? Can you afford to pay for them all? Are you governing their actions, or are they controlled out of Washington?

Oppose at every opportunity excessive government controls in industry and agriculture.

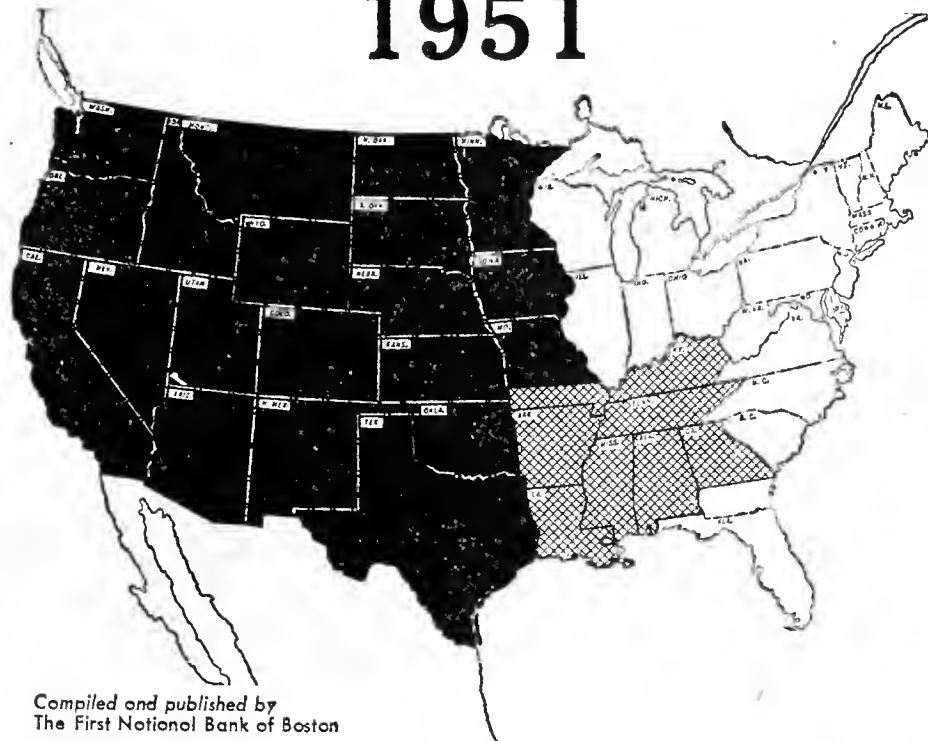

Watch out against the socialization of medicine, education and agriculture.

Emphasize and emphasize again the responsibility of the individual to stand up and be counted for the liberties which cost our fathers so much.

**FREEDOM IS YOUR BUSINESS.**

## THE DARKENING SHADOW

1951

Compiled and published by  
The First National Bank of Boston

**T**HE darkening shadow in this map shows that the Federal expenses alone for the current fiscal year ending June 30, 1952, will equal the estimated total income payments of all individuals in the blackened area, which is more than two-thirds of the entire United States.

If you add to the Federal expenses for one year those of the total state and local taxes, then the total government expenditures will equal the income of all the people in the states in the blackened area plus all of those in the states shaded on the map. In 1929 the dark shadow covered only about two-thirds of one state—California.

**THE GROWTH OF THIS FRIGHTENING SHADOW WILL NEVER STOP UNTIL YOU AND I AND OTHER DETERMINED CITIZENS LIKE US TURN IT BACK!**

# The Kind of America We Want

## Training

**EDITOR'S NOTE:** Here are the prize winners in our contest for young people on the subject, "What Kind of an America Do I Want?", together with quotations from non-prize winners.

### Give Me Freedom

**FIRST PRIZE, \$20.00**

**L**ET ME be heir to freedom, or let me live and die defending my individual right to be free.

Give me no promise of government-planned security. Slavery would be as kind a fate. For to be thus secure is to shackle human resources.

Security was not the reason the Pilgrim Fathers set sail across dark waters in their escape from tyranny. Freedom was their quest. I would be a Pilgrim.

Security had no part in the lives of the pioneers who traversed forests and deserts to make America a productive land. I would be a pioneer.

Security did not mold the character of George Washington, father of liberty and defender of freedom. I would be like Washington.

Security was not in the heart of the Emancipator whose convictions were that a government "could not long endure half slave and half free." I would be like Lincoln.

Security does not see men through panic. It never has been a guarantee of prosperity. It never has created a great idea, a new machine, or a better product.

Security does not win wars. It did not fire a musket in the Revolutionary War, nor was it behind the cannons at Gettysburg. It did not decide the victories of Belleau Wood and Chateau Thierry.

Security never has gained a beachhead. It did not raise the flag at Iwo Jima. It is not with the defenders of peace at Korea.

Free men of faith laid America's cornerstone. Let me, like them, be charged with the fervor to keep America free.

The light of freedom will illumine my mind, as I trudge the road of knowledge. Security is a stumbling block.

The energy of freedom will charge my body with power and health as I toil in the field of my own choosing. Security is a disease.

The force of freedom will summon my loyalty as I defend my country in times of war and peace. Security is a coward.

I am a happy American, not because I am secure, but because I am free.

I will not be a parasite feeding on the government's promises of security. I would be free. Give me freedom.

—Matthew Sasso, Muncy, Pa., aged 20.

—A.A.—

### Ambition Needed

**SECOND PRIZE, \$15.00**

**N**EVER in our history, have the principles on which this nation prospered been threatened as they have in the last twenty years.

This nation has been through a de-

## Winning Letters in a Contest for Young People

pression, war, and a prosperous post-war era, and our government is still operating in the red. It seems to me that too many people are relying on the government for support. Too many people have lost the ambition and foresight that is necessary in maintaining our hard-fought freedom that we enjoy today.

People, today, are trying to get something for nothing. It seems strange that we who have the highest standard of living in the world, and are the best educated, should allow our government to be undermined by the medieval heritage of socialism and communism.

It is time that we Americans woke up and concerned ourselves with the destiny of our country. Let us not allow our own individual desires to become so important that we neglect the freedoms which we have today. Our democracy today is dependent on us. We must not fail our duty!

Since world leadership has been

## Recreation

placed in our control, we are placing too much emphasis on re-arming and war. You can never have peace by preparing for war. World leadership demands the responsibility of helping undeveloped nations, and to promote peace and freedom in the world.

There are four main qualities we must cultivate if we succeed in maintaining our democracy. These are:

First, we must have faith in ourselves, for without this we have two strikes on us already.

Second, we must have faith in one another; if we have not this, we are struggling in vain.

Third, we must have faith in our country, faith that we are able to stand against the attacks that imperil our democracy and freedoms we enjoy.

Fourth, we must put faith in Almighty God who is willing and able to guide and direct us as a nation if we would but trust Him.

These are the principles which characterized our forefathers and to which we must return if we are to maintain and strengthen our democracy today. —Albert Skinner, R.D. 2, Rome, N. Y., aged 19.

—A.A.—

### The Coming Generation

**THIRD PRIZE, \$10.00**

**W**HAT kind of an America do I, a young person, want? Do I look forward to a future of guaranteed security or a future of freedom making my own security? It is a decision which I and every person, young and old must make, and we cannot—we must not—choose guaranteed security under governmental control! Freedom is as vital to us as the air we breathe. An American without freedom would

be like a fish without water. Without it our very spirits would die.

Why am I so determinedly for the cause of freedom? In my lifetime, government control would probably bring no more than a guarantee of security for my old age. Security is necessary to old age. However, I am looking farther into the future. My reason is only twenty-seven inches tall; weighs only twenty-two pounds and is only 10 months old. She is my baby daughter. She must have the same freedoms in her life that I have had in mine. She must have the freedom to worship God as she pleases. She must have the freedom to express her opinions. She must be able to choose her own life work, her own schools, her own friends and associates.

Our forefathers probably would never have ventured from their homeland if they had thought only of themselves. But thoughts of their children and their children's children drove them from their homes and relatives to cross a wide unknown ocean and settle in a strange land in quest of freedom.

There is nothing more inspiring and more soul-searching than the trust in a child's eyes. We must not fail them, our babies and children of today—the lifeblood of America tomorrow. We must not betray them by trading on their future freedom for our security now. So I say "Freedom at any cost!" —Mrs. David L. Nesbitt, Albion, N. Y., aged 20.

—A.A.—

### Freedom, Justice and Integrity

**FOURTH PRIZE, \$5.00**

**W**HAT I want for America's tomorrow is to keep and continue the economic and material status and advantages of the present, but to return to high moral principles and spirituality of the past which has made our country great.

Our material wealth is the highest known in the world. Science and American ingenuity have given us better conveniences and higher living standards. We have a longer life span than was ever known before. Every day some new research is undertaken to discover a cure for some disease previously considered incurable.

But the return to the past high standards of faith and love for God is the most important of all. Recently Ex-President Herbert Hoover remarked, "There is a dangerous weakening of morality and ethical standards in the very area in which we should expect to find integrity and leadership."

In former generations, whether Christian or not, people had moral standards, but now more and more people have given up their ideals of honesty and truthfulness.

Our country was founded on faith in God, and the men were true Christians. Perhaps we have signed away our freedom by giving up the faith of our fathers. Only the future can tell.

I close by asking the question General MacArthur asked in a recent

## Faith in God

## Work

speech: "In short, is American life to be characterized by freedom or servitude, strength or weakness?"

Those who truly love America hope that her tomorrow will be characterized by freedom, justice, and integrity. —Elaine Douglas, Afton, N. Y., aged 15.

—A.A.—

### Faith In God

Security is important. No one can live without it, but they can live without freedom. Those who have freedom often do not appreciate it. Those who do not have it would like it.

People in communist countries live (or exist) without freedom, but there are many who consider life not worth living without it.

I believe only faith in a Supreme Being is going to help bring about freedom and peace in this America. —Marie L. Wetterhahn, Ellisburg, N.Y.

—A.A.—

### Freedom Means Happiness

Freedom is a wonderful word and America is a wonderful country. I think Americans should be free to work at whatever trade they like best, and provide for their own security. Freedom to me means happiness. Happiness means good homes. Good homes provide strong healthy families, and strong healthy families provide clear-thinking citizens to work in our gov-

## Justice

ernment for the good and the benefit of our people. Therefore I am in favor one hundred per cent of freedom for our American people. —Jean Huson, Johnson City, N. Y.

—A.A.—

### Golden Opportunity

If the nightmare of hate and fear is ever to be dispelled and the blessings of peace secured to the liberty-loving nations of the world, our only hope lies in the preservation of those institutions which are the foundation and bulwarks of our political and religious freedom—those promises which America extends to her free people.

Thomas Wolfe very aptly sets forth the "Promise of America": "So then, to every man his chance—to every man, regardless of his birth, his shining, golden opportunity; to every man the right to live, to work, to be himself, and to become whatever thing his manhood and his vision can combine to make him—this, seeker, is the promise of America." —Cleda Howell, Bradford, N. Y.

# Here's WHY you get more years of work

# from a McCormick® Farmall

Every part in every tractor engine—from sub-assemblies to finished unit—has to fit correctly. Rigid inspections on every Farmall assembly line, at every step of manufacture, provide a constant check on product quality. This means longer tractor life . . . *more years of productive work* from your McCormick Farmall.

Every Farmall crankshaft is protected from hidden flaws with the "black light" of the magnetic flux machine. This machine detects the tiniest of imperfections, hidden from the naked eye. Quality controls like this mean *built-in performance* for you, *more years of work* from your tractor. Farmalls are built stronger to last *years longer*.

Every engine must deliver full power. Dynamometer tests make sure *every* Farmall tractor lives up to its rated engine horsepower *before* it leaves the factory. Hundreds of other inspections help build *more years of work* into your Farmall. These inspections assure you of quality and dependable performance, *always*.

## ...and more **PULL-POWER** for all your work

**More PULL-POWER for Mounted Implements.** Get acquainted with the *pull-power* you get with *every* McCormick Farmall. There's *balanced power* in the full line: Cub, Super A, Super C, H, M, MD. Try the size that's right for you and your work, with a full line of mounted and direct-connected McCormick equipment: plows, planters, listers, middlebusters, cultivators, mowers, many more. They're front, center or rear-connected at the right location to do *best work — easiest, fastest*.

**More PULL-POWER for Trailing Implements.** Test the Farmall *pull-power* that most closely matches your power needs . . . with your choice of McCormick trailing implements: plows, disk harrows, peg-tooth harrows, soil pulverizers, planters, many others. See how Farmalls' ideal power-weight balance delivers more pull-power than other tractors of similar or even greater horsepower. See how Farmalls can handle *more jobs on more acres*, at lowest power cost for you.

Make your friendly International Harvester dealer your headquarters for Farmall tractors and the full line of matched McCormick farm equipment . . . with performance built-in, for more years of work. See your IH dealer now for your 1952 farm equipment needs.

## INTERNATIONAL HARVESTER

International Harvester products pay for themselves in use—McCormick Farm Equipment and Farmall Tractors . . . Motar Trucks . . . Crowler Tractors and Power Units . . . Refrigerators and Freezers—General Office, Chicago 1, Illinois

Smells good — is good! For the tastiest, most uniformly flavored ham you've ever eaten — try the sure, easy Morton Way of curing. It's fast — it's complete — it's positive . . . cures hams, shoulders and bacon to a delicious perfection every time, cuts work, saves money.

Morton's meat curing products are ready-mixed, ready to use! You can follow your own favorite method of curing, too. The Morton Way fits your way . . . whether you use a dry cure or brine cure, whether you use a meat pump or not. See your dealer for Morton's meat curing products — the favorite of 9 out of 10 who use a scientifically blended ready-to-use-cure!

### MEAT FOR YOUR HOME FREEZER

The locker operator in your town can help you get the best results from your home freezer. He can show you why sharp freezing, proper wrapping and packaging is important in maintaining fresh flavor longer in foods stored in home freezers. Your local locker operator welcomes you to his plant and also welcomes the opportunity to explain the various services he has to offer toward helping you live better for less. See him next time you're in town.

# MEET EVERETT

## "The chipmunk who found complete security"

**O**NCE upon a time a young chipmunk named Everett was graduated from college and came home to visit his father, an elderly gentleman who lived under an oak log near Covington, Ky.

The first night he was home, Everett swaggered down the tunnel into the burrow dining room and helped himself to a big meal of his father's choicest seeds. Then he selected one of his father's best cigars, a full inch long and all Havana.

"It's nice to have you home again, son," Mr. Chipmunk said.

"Yep," said Everett. "Must be."

"But," said Mr. Chipmunk, "I sup-

pose you'll soon be leaving to look for a job."

Everett flicked his cigar ash onto the rug. "Not a chance, Pop. Definitely not a chance. The fact is, I don't like the whole economic system today."

Mr. Chipmunk twitched a whisker ever so slightly. "What's the matter with it, son?"

"No security," Everett chirped. "The way I see it, the state ought to take over. Give you a safe job, give you a snug, warm place to live, give you plenty of seeds to eat, give you free medical care, give you free clothes, give you—"

Mr. Chipmunk gently raised a pro-

testing paw. "Now, just a minute, son. I'm proud of the American system. Lived by it all my life. I've worked hard, managed to save a few seeds every year, and we've not done too badly. The mortgage on our log is fully paid up. I was able to send you through high school and Chipmunk Aggies. And in a year or two, I think I can retire—"

Everett grinned at him. "Wise up, Pop! *Wise up!* Why beat your brains out? If the state'll give you everything, what's the sense of scurrying all over the forest trying to earn a buck?"

Mr. Chipmunk's tail snapped irritably. "Now listen, son. In the first place, stop calling me Pop. In the second place, you'd find that if you got *complete security* you'd lose your freedom. If the state were to give you everything, it would *control* everything. Control your body and soul. I don't believe you'd like that."

Everett burst out laughing. "Stow it, old timer, stow it! You just haven't got the word yet, that's all. But you'll learn." He whacked his father a jovial blow across the stripes. "Say, sport, how about lending me the car tonight? Big dance going on down in the meadow."

Mr. Chipmunk reached into his pocket for the keys. "Drive slowly, son. Lots of rabbits tearing around in cars these days. You can't be too careful."

"Don't worry about this lad, Pop, I can drive circles around any little old rabbit that ever came down the path."

Next morning at 7 o'clock the phone rang be-

side Mr. Chipmunk's bed, "Sorry to bother you, sir," said a voice, "but your boy had an accident last night. Smashed up a couple of rabbits in a convertible. Frankly, sir, he'd been drinking. We had to put him in jail."

"I'll be right over," Mr. Chipmunk said tensely.

Twenty minutes later Mr. Chipmunk arrived at the jail, a formidable structure the chipmunks had built by inverting an iron wash tub and imbedding the rim in solid rock. The Sheriff led him to Everett's cell. Everett was alternately yelling and gnawing on the bars. "Lemme out!"; he squawked. "Lemme out of this place!"

Mr. Chipmunk stared sadly at his son for a moment. Then, suddenly, he gave a little chuckle. "What's funny?" Everett screamed. "Get me out of here!"

Mr. Chipmunk put a paw through the bars and patted Everett's head. "Tell me, son," he asked, "are they keeping you snug and warm?"

"Sure, but—"

"Are they giving you free medical attention?"

"Medical attention, he says! Get me out—"

"And I dare say the good Sheriff will find a safe, easy job for you—on the rockpile. Am I right, Sheriff?"

"Right," said the Sheriff.

"And I suppose that the Sheriff will even give you a free suit of clothes, a little number with horizontal stripes."

Everett looked aghast at his father. "Cut the comedy, Pop!" he wailed. "Get me out of this place!"

"No, son," said Mr. Chipmunk, "I'd like you to stay right here for a few days. I think you'll find it a rewarding experience."

"Why?" Everett screamed. "Tell me why, Pop!"

"Because, my boy," Mr. Chipmunk said, "it'll give you a very good idea what it's like to get *complete security* from the state."

Mr. Chipmunk winked at the Sheriff, put on his hat, and walked out of the jail.

# The CHOICE is Ours

By GENERAL DOUGLAS MacARTHUR

MUCH that I have seen since my return to my native land after an absence of many years has filled me with immeasurable satisfaction and pride.

General MacArthur

Our material progress has been little short of phenomenal. It has established an eminence in material strength so far in advance of any other nation or combination of nations that talk of imminent threat to our national security through the application of external force is pure nonsense.

It is not of any external threat that I concern myself but rather of insidious forces working from within which have already so drastically altered the character of our free institutions — those institutions which formerly we hailed as something beyond question or challenge, those institutions we proudly called the American way of life.

Foremost of these forces is the one directly, or even more frequently indirectly, allied with Communism. It has infiltrated into positions of public trust and responsibility—into journalism, the press, the radio and the schools. It seeks through covert manipulation of the civil power and the media of public information and education to pervert the truth, impair respect for moral values, suppress human freedom and representative government and, in the end, destroy our faith in our religious teachings.

This evil force, with neither spiritual base nor moral standard, rallies the abnormal and subnormal elements among our citizenry and applies internal pressure against all things we hold decent and all things that we hold right—the type of pressure which has caused many Christian nations abroad to fall and their own cherished freedoms to languish in the shackles of complete suppression.

As it has happened there, it can happen here. Our need for patriotic fervor and religious devotion was never more impelling. There can be no compromise with atheistic Communism—no halfway in the preservation of freedom and religion. It must be all or nothing.

## Taxes Sap Initiative

It was the adventurous spirit of Americans which despite risks and hazards carved a great nation from an almost impenetrable wilderness; which established the pattern for modern industrialization and scientific development; which built our own almost unbelievable material progress and favorably influenced that of all others.

This adventurous spirit is now threatened as it was in the days of the Boston Tea Party by an unconscionable burden of taxation. This is sapping the initiative and energies of the people and leaves little incentive for the assumption of those risks which are inherent and unescapable in the forging of progress under the system of free enterprise.

More and more we work not for ourselves but for the State. In time, if permitted to continue, this trend cannot fail to be destructive. For no nation may survive in freedom once its people become the servants of the State, a condition to which we are now pointed with dreadful certainty.

Labor, as always, will be the first to feel its frightful consequences.

This nation's material wealth is built upon the vision and courage, the sweat and toil, the hope and faith of our people. There has been no magic involved, upon which we might again call to replenish our denuded coffers. We can either advance upon the security of sound principles or we can plunge on to the precipice of disaster toward which we are now headed in the dangerous illusion that our wealth is inexhaustible—and can therefore be limitlessly shared with others. It is argued that we must give boundlessly if we are to be insured allies in an emergency. I reject this reasoning as an unwarranted calumny against well tested friends of long standing.

The survival of the free world is infinitely more dependent upon the maintenance of a strong, vigorous, healthy, and independent America as a leavening influence than upon any financial aid which we might provide. The free world's one great hope for survival now rests upon the maintaining and preserving of our own strength. Continue to dissipate it and that one hope is dead.

## Moral Integrity

Indivisible from this trend and probably contributory to it is a growing tendency to overlook certain forms of laxity in high quarters. Petty corruption in the public administration is a disease unfortunately common to all nations, but I refer to an even more alarming situation. Men of significant stature in national affairs appear to cower before the threat of reprisal if the truth be expressed in criticism of those in higher authority.

As I have traveled through the country since my return, I find a great transformation in American thought to be taking place. Our apathy is disappearing. American public opinion is beginning to exert its immense power. The American people are expressing themselves with dynamic force on foreign policy. This is exerting a profound influence upon the Soviet course of action.

Few events in the life of our Republic have been of more significant importance nor more heartening than this rallying of the collective will of the American people. They are putting pressure upon their own leaders and upon the leaders of those with whom we are directly or indirectly engaged.

We stand today at a critical moment of history—at a vital crossroad. In one direction is the path of courageous patriots seeking in humility only the opportunity to serve their country; the other that of those selfishly seeking to entrench autocratic power. The one group stands for implacable resistance against Communism; the other for compromising with Communism. The one stands for our traditional system of government and freedom; the other for a socialist state and slavery. The one boldly speaks the truth; the other spreads propaganda, fear and deception. The one denounces excessive taxation, bureaucratic government and corruption; the other seeks more taxes, more bureaucratic power, and shields corruption.

The people, as the ultimate rulers, must choose the course our nation shall follow. On their decision rests the future of our free civilization and the survival of our Christian faith. Not for a moment do I doubt that decision or that it will guide the nation to a new and fuller greatness.

## Veterinary AUREOMYCIN

Crystalline OINTMENT  
for UDDER INFUSION

*Lederle*

## FOR FAST ACTION

## Against MASTITIS and UDDER INJURIES

For quick, effective control of mastitis, the favored antibiotic of dairymen today is AUREOMYCIN Crystalline OINTMENT Lederle, the drug with the widest range of activity against mastitic organisms.

Available in convenient, easy-to-use infusion-tip tubes, this superior drug is steadily winning the praise of more and more successful dairy farmers throughout the country. Aureomycin remains active in the udder for more than 48 hours. It is more effective than penicillin, nonirritating and relatively nontoxic.

AUREOMYCIN OINTMENT is also highly effective when used to treat injuries to udder and teats—often forerunners of mastitic trouble. Consistent use of this low-cost drug will help maintain production of salable milk.

In cases of acute mastitis with septicemia, in addition to udder infusion with AUREOMYCIN OINTMENT, the injectable form of SULMET\* Sulfamethazine should be used. Subsequent treatment may be conducted with SULMET OBLETS\*.

VETERINARY AUREOMYCIN Crystalline INTRAVENOUS\*\* may be used in the treatment of severe acute septicemia as a highly effective agent against most bacteria.

For maximum efficiency in the use of AUREOMYCIN OINTMENT for Udder Infusion, as well as best management practices and disease-control procedures for avoidance of reinfection, consult your veterinarian.

Write for folder on AUREOMYCIN OINTMENT.

\*Reg. U. S. Pat. Off.

\*\*By, or on the advice of, a veterinarian.

## BIGGER LOADS and BETTER SPREADING

That's why a **NEW IDEA** is a good idea!

**NEW IDEA Spreaders** feature the finest box built! Built with prime, fully cured pine—extra-resistant to rot and corrosion. All boards tight-fitted and double-riveted to sturdy steel frame—less leakage, no loosening up under longest service. Lasts a lifetime!

**Wider Upper Cylinder and Tapered Bed:** No choking or bunching—manure feeds back freely and smoothly to the Wide-Spread Distributor.

**Smooth Ground-Wheel Drive:** Specially designed sprocket teeth give sure grip and easy release. Rugged, true-running, long-lasting.

**NEW IDEA-HORN Loader:** Makes a short, easy chore of manure handling and other heavy loading and lifting jobs. Types to fit wide range of tractors—10 labor-saving attachments.

Those flared side-boards on a New IDEA Spreader make a big, dollar-saving difference! Make loading so much quicker and easier, either mechanically or by hand. Make room for extra forkfuls in the wider-top wooden box. Make it possible to haul a lot higher load—with least loss along the road.

And your New IDEA Spreader makes every load a bigger payload! Even partially frozen chunks are chewed up fast by 100 sharp beater teeth. That famous Wide-Spread Distributor quickly cuts toughest manure down to best soil-building size. Handy levers permit positive control of coverage.

For sure shredding plus wider, uniform spreading—more fertility value to boost your yield per field—you'll find a New IDEA by far the best idea. But there's many another reason why it's the world's most-wanted spreader. Ask your New IDEA Dealer!

## Big Business IS ESSENTIAL

growth of our nation would be dramatically revealed if our newspapers were to report tomorrow that the owners of General Motors (445,000 stockholders) had decided to liquidate their investments and close the business.

### Millions Affected

**T**HE Communists and Socialists, and those among the so-called "liberals" who seek to establish the "Planned Economy" in America, have long used big business as their whipping boy. Of course all three groups know that their planned economy would necessitate, ultimately, the elimination of all private business. Therefore, much of their propaganda is designed subtly to create ill feeling toward the whole structure of American business by using big business as the focal point of their attack.

A preacher told how he came out of his university and entered the ministry infected with animosity toward big business, only to discover later how unjustified had been his attitude. Other people have frankly stated a belief that the country would be better off if the big corporations were forced to dissolve. These people have been reached by the campaign of misrepresentation and villification against business. It has been carried on unceasingly by the Left-wingers and quite often aided—surprisingly enough—by people in reputable institutions and on the staffs of publications and other mass communications media.

### The Biggest

General Motors is the biggest corporation in America. As such it often is the special target of the Left-wing mud-slingers. With every evil implication they can devise, they call attention to the big lump-sum GM profits. Usually with slyness, but sometimes openly, they suggest that this big sprawling industry is bleeding our country of wealth and preventing the people from obtaining their fair deserts.

The truth is that General Motors is the nation's biggest single producer of wealth. And since the welfare of every citizen is at least indirectly dependent on the measure of wealth produced in America, the company is making a substantial contribution to the general welfare. What GM and other big American industries mean to a great many people and to the economic health and

The incomes of the 465,239 General Motors employees would stop. Approximately 2,000,000 persons—wives and children as well as the bread winners themselves—would be directly and stunningly affected by the stoppage of their income livelihood, insurance, pension benefits, etc.

The GM yearly payroll of \$1,809,218,043 would be abolished. Business in some 50 cities with GM establishments would be hard hit; some of their sales and service people would be laid off or terminated. Many of the tens of thousands of companies selling GM products would close. Indirect effects would spread widely. The business of more than 12,000 GM supplier industries scattered throughout the 48 states would be lost or seriously curtailed and the jobs and income of their several million employees would be eliminated or made shaky.

Should GM close up shop, the national defense preparation would be critically stalled for a long time—for the company is the largest producer of materials for the armed services. Vast research projects, out of which come further great boons to humanity, would be halted if GM quit.

Hardest hit of all would be our local, state and Federal governments. The total taxes of \$1,536,000,000 paid in 1950 by General Motors into the government treasuries could not be realized from any other source unless corresponding wealth were created—except by dipping further into the incomes of all the taxpayers—including you and me.

If GM were to cease operating, five years or longer would be required for its productive might and wealth-making capability to be developed by another company or number of companies. It probably would take much longer for its total value to our nation and all 150,000,000 citizens to be re-established. Its value could never be re-established unless we kept our present system under which GM grew into being.

—The Harding College Letter

## Down the Tennessee River

**T**HE American taxpayer has been sold down the Tennessee River, as far as public power is concerned. The government definitely and directly said that it would develop the Tennessee Valley Authority as a flood control and hydro-electric project. But now the steam plants it is building will overshadow the hydro-electric and flood control part of the system.

The figures are: Being spent for hydro-electric dams and plants, \$90,600,000. Being spent for steam plants, \$421,500,000.

The people of New York State have paid approximately 22 per cent of the TVA improvements, yet they are now advertised to draw business and industry away from New York on the pretexts of cheaper land, cheaper labor, cheaper power."

This is an example of disillusionment which is becoming increasingly mark-

ed all over the country. The point is, of course, that we can't have a "little bit of socialism," which will stop at some predetermined spot. The appetite of socialists for power—and of the bureaucrats and officials who follow the socialist line under camouflaged labels—is insatiable. The more they get, the more they demand.

The people of every state helped, through their tax money, to pay for TVA. They are helping to subsidize its continued operation and expansion, and they'll do that as long as TVA exists. That goes for all the other current government ventures into socialism. The precedent now established, if not checked hard, will force us to pay in the infinitely more precious coin of lost liberties, and political domination of our lives. That is what the super state always results in—and Valley Authorities are super states in spades.

—The Syracuse, N. Y., Post Standard

# Roots of Responsibility

In a world that cries for sane reasoning, sound judgment and constructive actions, the farm population of America stands to contribute perhaps more than any other group.

The farmer's sense of individual responsibility finds its foundation in his traditional husbandry of livestock—probably the oldest and most noble art of man. The bond between man and the animals charged to his keeping is one predicated on the

farmer's warm devotion and unspoken pledge never to abuse nor neglect a fellow creature utterly dependent on his care.

In its early championing of an Animal Agriculture program (to build soil, increase livestock and upgrade the human diet) the New Idea Division of the Avco Manufacturing Corporation is proud to have lent encouragement to a concept of farm life wherein lie the roots of individual responsibility.

The barbecue is always a good drawing card and always top-notch for food. More than 1000 lbs. of barbecued beef were served this time.

# They Pulled Together

By Jim Knapp

Here's the new agricultural center for the Genesee County farm and home agencies. This is what the folks were working for. Plenty of free parking space in the rear.

**W**HOS AFRAID of the big, bad mortgage? Do you need money for a worthy cause? Want to know how to get people to turn out for a big event? Do you want to build goodwill for farmers among city folks?

Farm folks up in Genesee County in the western corner of New York state have faced all of these questions and can give you some surprising and heart-warming answers. They've raised better than \$60,000 in the past four years, they have a beautiful new home for their agricultural headquarters, and they've made many thousands of friends for agriculture in the county—all without a cent of government money.

What's the formula, if such it can be called? Certainly, it would include (1) have something worth working for; (2) get your own people back of it (you'll need plenty of volunteer help); (3) make everything as free as far as possible; and (4) put on a good show by having some outstanding attractions.

It was hard for me to see how anyone could make any money by giving things away, but up at Batavia late this summer I saw a lot of happy people. Kids were riding on a miniature merry-go-round—free! When they tired of that, right next door they got on a miniature train for a ride—free! Down the line there were a half-dozen ponies kept busy carrying the small fry all day long—not free, but only 10 cents a ride.

Then there were free exhibits all around the grounds, free demonstrations by Soil Conservation Service, 4-H club members and machinery dealers, free band concerts, free dress revues, and a free square dance in the evening. The orchestra played for free. Even admission to the grounds was free!

## Under One Roof

**I**T ALL started because the farm people were dissatisfied. They wanted and needed a new agricultural center. Tired of renting an old house from a shoe factory as Extension Service headquarters, they figured how convenient it would be to have all the farm and home agencies together under one roof. The SCS was on one street, Production Credit on another, and a local milk co-op away from all of them. Parking meters were in front of or near all offices. Farmers were irritated.

The upshot was a search for a new building, or perhaps to construct one. By chance they stumbled on an old mansion with an acre of land, once a proud home but at that time, four years ago, a civic eyesore. It was purchased for \$8,500, but even then the thought was to tear it down and to build on the site.

When a contractor found the old building in pretty fair shape structurally, with a firm foundation, the group decided to develop what they had, and a development committee took over. Agreements were made with the Federal agencies for space, but since these commitments, together with the Extension budgets, were not adequate to carry the building, let alone develop it, a lot more money was needed.

One idea was a campaign to develop the center. The local bank granted a maximum mortgage of \$20,000, and folks scurried around for pledges, ultimately topping this figure. Included was about \$400 in cash from business interests, but all in all

it was only about half of the amount needed for an enterprise that eventually was to run over \$60,000.

Then came the idea that met with general approval. How about a Field Day—a glorified Farmers' Day—where everyone could have a good time, including the city folks and youngsters, where no one would be gouged, where merchants could display their wares, and where good food would be served at reasonable prices. And to top it off, they would have an auction where perhaps some money could be made.

Hoping for a large indoor trade show, a committee sold space to machinery, home appliance, and other dealers. The response was so great that the local airport was selected as the site of the show. There was no electricity, so farmers themselves, helped by one paid electrician, raised the poles with manure loaders and tractors, and hooked into generators for the current.

The show netted about \$2,500, enabling the sponsors to complete the building to the point where it was formally dedicated in December, 1948.

Machinery dealers were so enthused and pleased with the show that the following year, 1949, a 2-day affair was inaugurated, and a 30-acre farm site selected. A barbecue was added, about 10,000 folks attended, and the net was \$6,000. A new feature was the addition of a livestock auction in addition to the general auction of household goods and miscellaneous merchandise, all contributed by homemakers.

In 1950, the third Roundup was staged on the same site. This tested the ingenuity of farmers more than any previous event. The weather was swell the first day. The horse show went off like clockwork, and the general auction was okay. The second day it rained, but a big crowd showed up, and 2,000 farmers who couldn't crowd into the big tent stood in the rain to bid. Tractors pulled out cars stuck in the mud. Profit that year: \$6,600.

## A New Site

**T**HIS year probably topped them all, and the crowd was estimated at close to 15,000 on a new fair-ground site on the edge of the city of Batavia. From a gross of about \$17,000 a net of around \$10,700 was realized. Again, the two auctions proved to be the outstanding financial successes, totaling around \$9,700. Food concessions accounted for \$4,700, and Dairymen's League and 4-H milk and pop stands, \$325. The trade show brought in \$1,600, and another thousand came from minor amusements, such as selling canes, ring-the-duck, and

Auctioneers are glad to cooperate in a good cause, and they really "go to town" in upping the bids. The people like the "show" as well as the bargains.

pony rides. The total profit was just sufficient to liquidate the old mortgage!

The barbecue was a sellout, as usual, with more than 1,000 pounds of prime beef, cooked nearly 20 hours before the Roundup, made available to the visitors. Music was provided by the cooperation of Local No. 575 of the American Federation of Musicians through a grant from the Music Performance Trust Fund of the Recording Industry.

The auctions, of course, don't just happen. A tremendous amount of work lies back of them as volunteer workers actively solicit goods and merchandise and cattle from farm and homes. Everything is contributed. This year, for example, Elba muck growers donated a railroad carload of onions, amounting to nearly a thousand bushels. Nearly 60 calves and heifers were given along with a dozen pigs, 125 pullets, turkeys, geese, 300 dozen eggs, 400 bushels of oats, a corn sheller and a corn planter. Other items donated included five cases of dog food, small tools, a '38 Chevrolet sedan (which the donor bought back for \$125), a hay baler, a lime sower, 10 sheep, an automobile spotlight, and a certificate for evergreens from a nursery. Even the auctioneers donate their talents, and there have been as many as four. They really are enthusiastic.

And here's a good point to keep in mind. It's a lot easier, say the workers, to get contributions of "things" than it is to part people from their cash. But these "things" are just as good as cash on the auction block, because both city and country people can buy needed items at reasonable prices.

## Youngsters and Ladies Help

**I**T'S A good policy, also, to vary events and add new features from year to year. It adds to the drawing power. This year's program, for example, included a 4-H dress revue as well as demonstrations, a 4-H plowing contest, a livestock judging contest, and two extra band concerts. A square dance is always a drawing card.

And don't forget the women! Without them you won't get very far. At the Roundup they manned the food tents and had a good meal or a snack available at all hours. Everything's done with a smile, too. That pays! And don't neglect the 4-H club members. They've got ideas and they're not afraid of work.

When you get right down to it, the secret of success is the all-round cooperation, good ideas, and willingness to work of all concerned. Get a man like James H. Park, secretary-treasurer of the local production credit association, to serve as general chairman. He did it for four years and gave both the skill and continuity necessary. Get a man like R. V. Call to serve as chairman of the finance committee, and on whose farm the Roundup was held for two years. And find a man like Harold Shepard, Cornell graduate, to head the auction committee, and you have the nucleus of "sure fire" action.

Finally, you'll need a lot of volunteer workers. To put over the Genesee Roundup, there were 5 planning committees, 45 working volunteer committees, and probably 500 others who gave willingly of their time and labor where needed.

Many of the features of the Farmers' Roundup program are also being successfully used in other counties of New York State which are likewise interested in having a central home for the farm and home agencies. It does work!

# More Power from Niagara

## *5 Electric Companies Ready to Start Vast New Development*

A 1950 treaty with Canada has opened the door for development of vast new supplies of electric energy from the Niagara River. The treaty permits the utilization of additional water for power production purposes, and at the same time preserves the scenic beauty of the famed Niagara Falls. Three bills authorizing such a project are before Congress. One, the Private Enterprise-Capehart-Miller Bill, would permit the five New York State electric companies to do the job. The other two bills, the Lehman-Roosevelt and the Ives-Cole bills, ask for government development and ownership.

### **A JOB FOR THE ELECTRIC COMPANIES**

In order to make the benefits of additional Niagara Power available to the greatest number of people, five New York State electric companies propose jointly to finance and construct this development. They can do the job quicker and more economically than anyone else. And they are ready and able to push the job to the earliest possible completion.

The five companies constitute an interconnected group of utilities serving practically all of New York State. They have the combined experience and familiarity with the problems involved to undertake this project immediately. For more than fifty years, electric companies have operated plants on the Niagara River. For thirty years they have been ready with overall plans for the

River's development when more water should become available.

### **NO COST TO THE TAXPAYERS**

In pooling their resources, these five companies are pledged to do the job quicker and cheaper than any governmental agency . . . and at no cost to the taxpayers. In fact, it is estimated they will pay over \$23,000,000 a year in taxes in addition to the \$136,000,000 in Federal, State and local taxes they are paying now.

There is no need to add to the public debt for the development of new power at Niagara Falls since this project has no connection with any function of government. It

does not involve navigation, reclamation, flood control, irrigation or sanitation. It is strictly a project to provide more electric power—nothing else.

The Niagara River is one of the largest sources of unused hydroelectric power left in North America. The five New York State electric companies are ready to put this potential power to work for the nation's needs—they know how to do the job quicker, cheaper, with no public funds. All that the five companies need to set the wheels in motion is Congressional approval.

The Five Companies Can do the Job Quicker, Cheaper, without Public Funds.

**Central Hudson Gas & Electric Corporation • Consolidated Edison Company of New York, Inc.**

**New York State Electric & Gas Corporation**

**Niagara Mohawk Power Corporation • Rochester Gas & Electric Corporation**

**Quick-Hitch Cultivator** with delayed rear-bar action assures clean, uniform cultivation to end of rows.

## TOOL UP for full-yield farming with Tractor-Matched Implements

Now, you can have both faster farming and the kind of job that makes you proud.

Passing into history is the idea of merely hitching a tractor to an implement. New-Type A-C Quick-Hitch hydraulic implements are so perfectly matched to Allis-Chalmers tractors that they join as one. Your tractor actually becomes a power plow...power planter, cultivator or mower. And you quick-change from one to the other before the engine cools...including shifting wheel spacings when necessary...with engine power!

Test the easy vision and instant hydraulic response of the new Allis-Chalmers TRACTOR-MATCHED implements. This is *advanced* tractor-implement farming.

**Mounted Plows** are led from a forward tractor hitch point. Traction Booster assures uniform, even-depth work.

**Short-Drop Drill Planter** does accurate work at tractor speeds. Hydraulically lifted. Fertilizer equipment available.

**Field Cultivator** is an ideal seedbed conditioner. Hydraulically controlled for shallow or deep penetration.

**A-C Tractor Mower** cuts square corners without crop waste. Fast, smooth operating...on level or rolling fields.

**ALLIS-CHALMERS**  
TRACTOR DIVISION • MILWAUKEE 1, U. S. A.

ENJOY the National Farm and Home Hour every Saturday — NBC

## Private or Public Ownership? A TEST AT NIAGARA

**T**HERE'S power in the Niagara River. It represents one of the largest sources of hydroelectric power left in North America and it's going to be developed without changing the scenic beauty of the Falls.

Five utility companies are ready now with plans and \$350 million of private funds to tap the river for a million more kilowatts. Such a development would bring local, state and Federal government about \$23 million a year in additional taxes and save, through its efficiency, \$17 million in production costs compared to steam-production of power.

Thus the further development of Mighty Niagara would represent a total public benefit of \$40 million a year if it is done by private enterprise.

### Government Competition

But there are some of our government leaders who see another kind of power in Niagara. They want to develop more Niagara power as a government project. That would mean hundreds more on the government payroll, \$350,000,000 more of our tax dollars to spend on construction costs, and again would put government in direct competition with private enterprise.

Under government ownership the huge development would become tax free—a loss of \$23 million a year every year from now on. Interest on bonds for the project would run millions more out of taxpayers' pockets and those communities where property was taken over by government would lose that property from its assessment rolls and once again the privately-owned property in the communities would have to make up the loss.

As was stated editorially in the Ithaca (New York) Journal, "If it were impossible to develop Niagara power privately, there might be some reason for public development. But here are five companies willing and eager to use their own instead of tax money to build this project and thus add to the tax-paying base of both the state and the nation..."

These five companies\* are ready and willing to undertake the program just as soon as congressional and presidential approval are given to legislation now before Congress.

### Faster and Cheaper

Furthermore these companies can do the job faster and at less cost than government agencies. They have the know-how. Tackling big power projects is not new for these electric companies. As a matter of fact, the Niagara development, despite its size, is less than 60% of the two million kilowatts of new capacity that these companies now have under construction elsewhere in New York State! The \$350 million, large as that amount is, is just a little more than the five companies are spending currently each year for new construction.

Under private construction the first power from the new development would be available in three years but army engineers testified in Congressional hearings that "power (under a Federal project) from the first generating unit can be put on the line in five years, and the entire project completed in about seven years."

The use of Niagara River water for power has been limited by a treaty with Great Britain in 1909. In 1950 a new treaty between the United States and Canada was ratified under which additional water can be diverted from the river for power purposes. This treaty assures the protection and preservation of the scenic beauty of the Falls.

As a result of the new treaty, three separate bills have been introduced in Congress. One, the Lehman-Roosevelt

Bill, proposes that the Federal Government construct the power project from public funds. It contains provisions for the eventual transfer of the project to a New York State agency under certain specified conditions which State representatives argue would never be realized. It also calls for preference in the sale of the power to certain groups of customers, and provides for governmental transmission facilities.

The second measure is the Ives-Cole Bill, which provides for construction of the project by New York State with

### Transportation

**T**HERE is over \$100 billion of private and government funds invested in transportation — or nearly one-fifth of the capital values of this nation. So large a segment of the American economy represents the keystone in the arch of economic freedom. Whatever happens to transportation, in war or peace, will point the way to the kind of country we shall have when reason and justice return to our troubled world. — Donald D. Conn, Executive Vice President Transportation Association of America.

funds from tax-free revenue bonds. That measure proposes that the power from Niagara be sold through existing facilities, if contracts can be made, but the New York State Power Authority would control rates to be charged the ultimate consumer.

The Capehart-Miller private enterprise bill would, on the other hand, permit additional development of the Niagara River quicker and at lower cost than either of the other measures. It would be done without cost to taxpayers.

### Record of Service

For 30 of the 50 years since they first tapped Niagara for power, the private companies have been producing and selling power to industry, farms and homes. They have had plans for additional development at Niagara. Those same plans are the basis for engineering recommendations for the power project by the Federal Power Commission.

Briefly, the five-company plan calls for construction of a new power plant in the Niagara Gorge seven miles below the Falls near Lewiston, with an installed capacity of 1,080,000 kilowatts. This plant would utilize the full drop of the Niagara between Lakes Erie and Ontario. Three tunnels would carry the water from the upper Niagara River to the Lewiston plant.

The five companies, in opposing construction of the project by an agency of government, argue that Congress should reject a course which requires the expenditures of large sums of public funds, adds to the public debt, and results in the loss of substantial annual tax revenues.

The five companies have a record of many years of successful developments in the electric utility field. They now serve ninety per cent of New York State. They operate an integrated network of transmission and distribution facilities which could and would spread the benefits of Niagara power throughout a wide area. They are ready to put this potential power to work for the nation's needs.

\*Cooperating in the private enterprise proposal for Niagara's development are Central Hudson Gas & Electric Corporation, Consolidated Edison Company of New York, Inc., New York State Electric & Gas Corporation, Niagara Mohawk Power Corporation, and Rochester Gas & Electric Corporation.

## The Requirements For Leadership

MUCH IS said about the importance of leadership, and considerable effort is expended by various groups in what is called "leadership training." Without question, sound leadership is needed, but it is also certain that it is something which cannot be easily imparted to any individual. Rather, it is something that must be won.

It seems to me that there are three outstanding requirements which must be met before any individual can be called a leader:

1. **Courage.** The man who waits until everyone expresses his or her opinion before taking a stand can never be a leader. A leader must have the courage to speak first and to speak even though he knows that what he says will be unpopular.

2. **Ability.** It is not enough to have the courage to speak out. A leader must have the perseverance to get the facts, and the intelligence to analyze them correctly. In the long run, he must be right most of the time or he will have no followers. No one can be a leader unless he has someone to lead.

3. **Unselfishness.** The man who uses courage and ability to become a leader will soon lose his followers if they find that his leadership is being used to further his own ends.

And finally let us remember that a leader must have followers if he is to be effective. If, after a cold self appraisal, you conclude that you lack the qualifications for leadership, what then? Just pick a leader who does have the qualifications and become his faithful follower.—H.L.C.

—A.A.—

## THE RESPONSIBILITIES OF CITIZENSHIP

IN THE proper performance of our responsibilities as citizens, it would seem that these points should be kept in mind and practiced:

1. Our government is you and I and all of us, operating together through our elected representatives.

2. It will furnish the services a majority of us request. The enormous total of public services we now have, with relatively few exceptions, have been furnished on that basis.

3. Government cannot provide us with a penny's worth of service if it does not get the penny from us.

4. We want efficient operation of the public affairs and have the right to demand it. But we have no right to grumble or complain about the legitimate cost of the service we have requested.

5. We have no right to milk the public for personal and special-interest service beyond what a healthy conscience knows is a proper public expense.

6. We have already requested services from government to a degree which has brought heavy tax burdens to everyone. If we want relief from these taxes we can accomplish little by attempting to shift the burden to others, and can best proceed by retracting somewhere on our demands.

7. We are duty bound to be informed citizens, to know the facts of our public affairs, to camouflage these facts from neither ourselves nor others, and to be statesmen in exerting our influence.

8. We are a rich country. We are not so rich but we must ask of every dollar of public expense—just as we do of a personal dollar—are we getting our money's worth? We cannot have everything we want, either from our own purse or from government. We must not tax to a point that kills production incentive. We must live within our means or our means will be less.

—Herrell De Graff. Reprinted courtesy John T. Graff Co., New York City.

## 30 Fateful Years in the History of Dairy Farmers; Advances Gained Through the Efforts and Influence of the Dairymen's League Co-Operative Association

Thirty years ago, the Dairymen's League Co-Operative Association, Inc., took the place of the former Dairymen's League, Inc. The old organization was a simple bargaining association, striking the best bargain it could with powerful dealer interests. The new organization set up standards for those interests to follow; and it built up collection, transportation, processing and selling facilities to enforce those standards.

Let's look at the gains dairy farmers have won during the 30 fateful years since 1921:

### THEN...1921

- Every dairy farmer was faced with complete dealer domination and one-sided contracts which he was forced to line-up and sign—a system designed to keep the farmer in a state of humiliation and meek submission;

- Farmers, without experience or knowledge of the true facts and costs of the milk industry were forced to accept unfair and often unscrupulous terms;

- The contract, always in the dealer's favor, established the price which the dairy farmer was to receive;

- The contract gave the farmer no assurance of a market beyond a month, or six months at the most;

- Short weights and tests were common methods by which dealers made up losses caused by low retail prices or by waste and inefficiency on the dealer's part;

- Many of the milk buyers who offered these contracts were of the fly-by-night type; here today, gone tomorrow. The farmer was left holding an empty pocket-book;

- Dealers controlled the facilities between the farmer and consumer and could close these avenues at any time, blaming the farmer for the consumer's failure to receive milk;

- Dairy farmers, shut off from the market, had no other outlet for milk, but were left helpless and despairing;

- Farmers had no one with specialized knowledge and experience to represent them before government agencies and bureaus; those who did appear in legislative halls of state and nation to complain about the abuses, were either ignored or insulted.

### NOW...1951

- Every Dairymen's League member enjoys a fair, mutually helpful and business-like contract;

- The contract assures him of a market for all of the milk he produces every day of every year;

- The contract assures him of a fair price based on the going market; a price that is adjusted to business conditions affecting that market;

- The contract gives him the right to have weights and tests checked by men of his own choosing;

- The contracts are negotiated by dairy farmers acting with his authority, and are made only with outlets of established business credit and reputation;

- When strikes, demand or other influences reduce the market for milk, the contracts are protected by Dairymen's League-owned facilities which divert fluid milk to other classifications;

- The contracts are made by a Co-Operative Organization of dairy farmers who collectively possess more knowledge and facts about the dairy industry than any other group in the country;

- This knowledge and these facts, when presented by skilled and experienced representatives of organized dairymen cause legislatures, government bureaus, bureaucrats and all the miscellaneous rank and file of planners and controllers to give respectful attention to dairymen's views.

Finally, the rights, status and economic justice granted to members of the Dairymen's League cannot easily be denied to other dairy farmers. Thus, every dairy farmer in the milkshed today is more independent, enjoys a more secure income and a more equitable payment for his produce than he would receive had the Dairymen's League Co-Operative Association not pioneered the way. *The 30-year history of the Dairymen's League Co-Operative Association spells progress for all dairymen.*

# Can Socialism Be Stopped?

## Most Readers Say "Yes"

### Some Call it "Progress"

**T**HE ONLY people who can tell us what our readers are thinking are the readers themselves. That's why we wrote a scattered representation of AMERICAN AGRICULTURIST readers a few weeks ago to get their ideas to pass on to you in this Forum Edition.

We said, "Occasionally we hear the statement that we in this country cannot stop the trend toward paternalism, socialism and statism in our government," and then pointed out, "If that statement is correct, it seems to us that we are doomed to more government in business, bigger old age assistance checks, socialized medicine, more government employees, more government controls, higher taxes and less liberty."

We asked the readers we wrote to: "If you think we are wrong in that conclusion, will you tell us why? If you agree with us, do you think the trend toward statism can be stopped? If you think it can, what do you think should be done to stop the trend and what can you as an individual citizen do to help change the trend?"

Below are excerpts from some of the interesting answers we received from our readers:

#### Make Government Respected

Tearing down big business will only reduce our standard of living. Through development of co-ops and unions we must meet big business in the market place on equal terms.

As individuals we must make government work respected and attractive and elect only those who deserve respect for their ability and intellectual maturity.

In my opinion the way for individual citizens to stop the trend toward socialism is to substitute reason for wishful thinking when we are making decisions about what constitutes our best interests in the long run.—*Elmer E. Towne, Montpelier, Vt.*

#### Won't Hurt Santa Claus

I think that this trend can be stopped if all the taxpayers and self-supporting citizens would vote on Election Day. Instead, the non-taxpayers and the non-self-supporting voters are all out and they sure won't hurt their "Santa Claus." I also think people could keep in contact more with their congressman and listen to less "red" propaganda.—*Gerald Casler, Fort Plain, N. Y.*

#### Less Spending

A drastic reduction in the Federal budget is essential. To bring this about, vote, write to congressmen and senators and watch local and state government expenses.—*Allen Child, Malone, N. Y.*

#### More Services, Less Freedom

A lot of waste could be eliminated in hiring government employees. Every time a new bureau or department is established, it becomes self-perpetuating. A bureau chief's importance increases as his staff increases. Consequently he tries to get bigger and bigger so his bureau will be more important and get more money.

The more services we receive from the government and the more security

we demand, the less freedom we will have. However, let's not lose our freedom while fighting socialism, communism and other isms. The controls imposed, the hate generated, the prejudices carried by individuals are as dangerous to our liberties as any socialistic scheme.

The issues that bring socialism to the fore must be solved. I believe we can do it without becoming socialistic, but if we do not solve our problems, we will go even further than socialism.

Our citizens must take a more active part in running the government. A friend of mine in Washington told me that many congressmen would vote to reduce appropriations if they felt the people back home were behind them.

Many old people through mismanagement or circumstances beyond their control have no means of support. Here is a problem that must be met. The social security program by the Federal and State governments is one

scene. This requires modification through federal branches of the Washington agencies at the regional and local level, often paralleling already established state agencies. This tendency to take matters out of the hands of state governments should be curbed, both in the interests of greater efficiency and in the interests of economy.

It seems perfectly clear that the survival of the American way of life in the next decade is going to depend as much upon bringing expenses into line with income as upon any other thing.—*Henry Mosle, Litchfield, Conn.*

#### Truth Wins

We can slow down this statism, etc. in government if the farm organizations will constantly give their members facts which prove our present course to be wrong.

Farm people must first clean their own houses; then after an example has been set, point it out for others to

This group of young people gave their thoughts on some of the problems facing youth at a community forum at Lafayette, Onondaga County, recently. Not one of them suggested socialism as an answer.

From left to right they are: Nancy Hencle of Baldwinsville, 4-H Club member; Richard Moss of Jamesville, also

representing 4-H Clubs; William Schneider, Jr. of Elbridge, representing Grange youth; Stuart Wilhoite of Minoa, Onondaga County, FFA president; George Schurtliff representing rural churches; Donald Gondeck of Kirkville and Dick Woodford of Lafayette representing the Young Co-operators.

solution. It does no good to say, "socialistic" or "bad." The problem of old age income must be met if our society is to survive.

Government cannot be left out of our lives completely. As I see it, the American way is not complete individual enterprise, but rather people in a group enlisting the support of the government to secure a gain.—*Roger Glason, Groton, N. Y.*

#### More Power To States

In Connecticut, existing legislation contemplates taking care of the unemployed out of the public purse at a rate which would bankrupt the state in a short time if unemployment became general. Connecticut is more than 50 per cent wooded. Many of the unemployed could be trained to work in the woods. There is a great demand for wood products in Connecticut industry. Woodland improvement could be financed by the equivalent of a chattel mortgage on the eventual timber crop at private expense.

Such action would tend to improve Connecticut's water supplies. And the initial requisite—to find employment for the unemployed—would have been met. The principle here is to make these projects useful, rather than to use them to multiply the already crushing burden of public debt.

Federal projects tend to be blue-printed in Washington with the result that they do not usually fit the local

follow. This trend is now evident.

There are records in history relating the disaster which has come to all peoples who have tried these "isms." Let's bring all these facts to light. Only truth, facts, and enlightenment will overcome the deceit which our government is now directing. A well informed public is our best weapon. It can be stopped. It must be.—*A. L. Towson, Jr., Elmer, N. J.*

#### Moral Fiber

It is my belief that the individual citizen has many opportunities to expose true facts and help change this trend.

First, it is moral fiber that keeps our liberty ever before us. The individual can always be heard and can always serve in a church of his choice.

Our organizations need the support of clear-thinking rural people and participation by them in every way. Such a list might begin with P.T.A. and our schools and go through the whole list. The individual has the responsibility and exerts the most influence.

—*Clarence Rea, Cambridge, N. Y.*

#### Takes Time

I don't believe the trend toward socialism can be stopped short. Perhaps we should not expect such. History shows some human progress with each reform.

I think the trend will develop further before a definite change can come.

Probably the greatest influencing factor is the encouragement on the part of government for spending. All of us want America to be strong, but pouring money (public money, taxes) down a rat hole will not build a stronger America.—*E. S. Race, Belvidere, N. J.*

(EDITOR'S NOTE: Surely many will agree that Mr. Race is right. Part of the mess we are in is due to the impatience of those who want to cure every problem today or next week. But let's work to start the trend in the other direction even though the progress may be slow).

#### Profits Essential

If I had as little regard for money or costs of operation as the government has, I would be out of business in a year.

If every business had its portion of the tax dollars that it costs the government to operate, each would be prosperous and create an active economy which would be on firm foundations.—*John L. Hendrickson, Middletown, N. J.*

#### Different Meanings

Liberty is a much abused word, meaning different things to different people. Individuals, like nations, can lose it in a variety of ways. Obviously, as our population continues to increase, we shall be faced with more and more adjustments to our way of life. It might be better to search for

ways and means to meet these adjustments rather than to indulge in somewhat foolish attempts to halt the march of progress.

How we make these adjustments and how wisely they are administered will depend upon the moral ideals of all of us. While it is to be regretted that there is dishonesty in high places, the facts are that it is probably not as great or as wide-spread as among the rest of us. If we, as individual citizens, are doing our part, those whom we elect would hardly dare do as a few have done.

Somehow I just can't get very much upset over the individual who is shouting that income taxes are ruining him but who, along with the rest of the country, is helping to spend ten billion dollars a year on intoxicating liquor. Those in a position to know claim as much or more is spent on illegal liquor. Add to that the \$200 or \$300 spent each year by most couples on tobacco and certainly there is available the means to finance those programs which make for progress.

—*Floyd E. Mörter, Freeville, N. Y.*

In closing we would like to thank our subscribers who wrote so interestingly, even though we disagree entirely with a few of their comments. Wasn't it Voltaire who said, "I disagree thoroughly with what you say but I will defend to the death your right to say it."

Mr. & Mrs. York State Farmer

# TUNE IN ON THIS PROFITABLE LISTENING

**T**HOUSANDS of York State Farmers in from their fields for lunch have been profiting from Lee Hamrick's up-to-the-minute interviews with farmers, agricultural leaders and men who have proven ideas for making farming pay.

It's an informal lively half-hour. It's easy profitable listening over your Rural Radio Network station each Tuesday, Wednesday and Thursday at 12:30 p.m.

It's brought to you by the railroads which serve you in New York.

## THE RAILROADS WHICH SERVE YOU Mean these things to YOU

### We're One of Your Best Customers

Our dining car services buy more than a quarter of a million dollars worth of your farm products each month. Add to this the steady buying of your farm products by 133,000 well-paid railroad families in New York, and you can see how much we railroads mean to you as your customer.

### We Pay Large Taxes to Your Community

In many counties in New York railroad property tax payments are more than a third of all property taxes collected. In addition, railroad taxes to school districts pay for the education of 20,000 rural school children each year. We free and enterprising railroads are the only transportation system in New York paying all our own way, in addition to supporting your local government services with our taxes.

### We Have Served Your Transportation Needs For 120 Years

Today there are more miles of railroad track in New York than the entire state highway system. This vital network serves you today, as it has for 120 years, with all-weather, low-cost transportation. And you pay for our service only when you use it, for our tracks, stations and equipment were built and maintained by us at no cost to you as a taxpayer.

# The De Laval Combine Milker AND REFRIGERATED FARM TANK CUT COSTS...INCREASE PROFITS\*

\*At the milk plant the pickup tanker ties directly into the plant milk line and becomes, in effect, the holding tank and receiving room. The savings to both milk producer and processor are obvious.

Milking the greatest number of cows with the least amount of help... getting the milk from the farm to the milk plant at lowest cost and with minimum handling... producing higher quality milk and getting paid for all of it... cutting down the loss and waste of rejected milk—these and many other advantages are being enjoyed right now by dairymen using the De Laval Combine Milker with refrigerated farm tank.

This De Laval Combine Milking system is truly straight-line milk production with every bit of non-profitable walking, carrying, pouring, straining and can handling eliminated. Write for the full story today. P. S. Bulk tank pickup... elimination of the milk plant receiving room... the end of can handling, repairs and washing and other economies are facts for milk plant operators to study and consider. Write for Bulletin SA 769.

\*The De Laval Combine Milker and refrigerated farm tank comprise a single milk producing unit which provides a straight flow of milk from cow to pickup tanker—without handling!

## Reaching the Hearts and Minds of Men

By JAMES A. FARLEY

IN politics, to which I devoted a good many years, the major purpose is to reach the hearts and minds of men. To be successful, the man in politics must gain the confidence of enough voters to persuade them to vote as he suggests. His entire life is devoted to an effort to please and to persuade. Sometimes, of course, he must, if he is honest, temporarily at least say some plain and unpleasant things. But in the long run, unless he does win and hold the confidence of people he cannot be accounted a success.

James A. Farley

This winning of the hearts and minds of others has been a recognized art for a long, long time. There were books written about it more than 2,000 years ago by the Greeks. Aristotle's great book on Rhetoric is a discussion on how to use words to win the confidence of others.

### Good Manners

In the first place, a person who is concerned in persuading other people to do something or buy something or just to be friendly and helpful must have what I shall call good manners. Now good manners is something more than knowing how to hold your soup spoon or how to dress when you go to a church wedding. It is much more than a capacity to say the pleasant but insincere thing. It is much more than mere tact. It is to feel and, above all, to show that you have a genuine concern in others. It means caring for people, respecting them, treating them as equals and sharing their fears and earthly concerns and their ideals.

Closely associated with good manners is what we call good humor. What I mean is the manifestation in all outward dealings with the public of a calm and friendly disposition. This is especially true in politics. We have learned in that very complex art that the most certain way that a man can defeat himself is to get angry.

I have, throughout my life, made it a habit, not only in politics but in business and socially, to help that memory by keeping a brief memorandum of anything which seems important, and at the same time incomplete and unfinished. I keep that memo until the matter is closed. It is a simple, easy way to stay abreast of responsibility and pending situations; let us call it a profitable bit of detail.

### The Other Fellow

Another good rule in politics, business and daily life is always to keep in mind the fact that the other fellow is deeply concerned with himself. There is a lot of unselfishness in this world, but there is an awful lot of selfishness, too. Our own problems seem to us to be more important than anything else in the world. We want to hear about them; we want to have the other person address us in terms of our own needs and aspirations and ideals and desires.

That brings me to what might be called the personal note in addressing other people. The most successful appeal that we can make is, figuratively at least, to sit down with them, listen to them, ask them about their problems, manifest an interest, and above all talk to them in terms of their own lives and their own understanding.

And now I want to speak very seriously about the most important way

**WE CANNOT** achieve security and prosperity by striking terror into the hearts of our fellow men. We cannot achieve peace and prosperity through spending more than we collect, by mortgaging our future, by making citizens dependent on the Government for livelihood and by pitting class against class. We must rally to those leaders who would preserve principles of freedom and justice. And we must rally behind every effort to strengthen our national defense against ruthless and bloody aggression.

James A. Farley

of reaching the hearts and minds of men. It should always be remembered that men do not live by bread alone. Our appeal must be constantly to what is noble and idealistic and unselfish in men. I mentioned earlier the fact that we must remember that a man is concerned with himself. I did not mean by that that his personal concerns are wholly materialistic.

### Spiritual Values

We are hearing today altogether too much in politics about what this or that party or this or that policy has to give toward the material needs of citizens and voters. I have heard and read speeches in the last two or three years in which farmers, workers and others were addressed as if they had no concern in the world other than better prices and higher wages. I think the people who are doing that have lowered their sights too far. People are concerned with the fine objectives of human life, with spiritual values such as patriotism, the love of home, and the love of God.

In fact, I deplore the cynical attitude that prevails in high political spots in this country and in others. We are told that if the act of a public official is not illegal, it is necessarily proper and always excusable. We are told that there is a fundamental difference between what is illegal and what is improper. I do not see this difference, because what is illegal is merely one of the improper things that happens to have been the subject of legislative action. We have got to pass judgment against and, so far as we can eliminate, the improper as well as the illegal in our public life.

### Moral Leadership

Our public servants elected to high office have a duty far greater than that of merely enforcing the law and collecting taxes and spending our money. They have the duty of moral leadership in the country. For if they do or condone or permit things that are improper they are destroying the very fabric of public morals, and the poison moves down into all of the ranges of our population. When men in high places make hundreds of thousands of dollars through their improper acts it is a hard way to maintain purity and integrity in the sports of boys in college and on the sand lots of the nation.

Behind all of our relations with our fellow beings there must be a common faith—faith in the fundamental integrity of man, in his constant effort to realize his highest ideals and his essential nearness to God. It is that faith that in the last analysis moves the hearts and minds of men. It is the faith that makes great people and a great nation.

The foregoing is part of a talk given by the Hon. James A. Farley at Ithaca, N. Y., on May 12, 1951.

# The Place of Farm Organizations In Our American Economy

By ALLAN B. KLINE President, American Farm Bureau Federation

**A**ERICAN farmers have a responsibility far out of proportion to their numbers. Not only do they supply the food and fibre essential to the people of the United States, and substantial quantities for export, but they are the bearers of an important part of the American tradition. No other group so exemplifies the independence, the initiative, and the free use of opportunity which underlie the American character.

Allan B. Kline

Only about 17 per cent of the total population of the United States lives on farms. Of this small minority in agriculture, about half produce some 90 per cent of all the agricultural commodities which move in trade. The economic significance of this group is scarcely a matter for argument. Its social and political importance is likewise beyond question. It is therefore of the utmost importance that American farm people have a voice in public policy, and that that voice be an honest, democratic and genuine reflection of the real thinking of rural America.

## Let Farmers Speak

Certainly it has become clear in the last few years that there is no lack of individuals and groups, in government and outside it, ready and willing to undertake the job of speaking for farmers. But I am convinced that nobody is quite so well qualified to express farm opinion as farm people themselves.

This is an age of "bigness", and an age of organized action. Big labor, big business and big government, whether we like them or not, are among the economic facts of life in America today. Farmers, generally speaking, are relatively small operators. They are independent producers, engaged in an enterprise which combines the functions of labor, management and capital. To survive and prosper, farmers must cooperate with one another in the economic field; they must present a reasonably united front in dealing with government, and they must depend largely on joint effort for social improvement and the general betterment of rural living.

To keep pace in our present-day economy, and to make the most of their individual opportunities, farmers must be organized. It is characteristic of American farm people to want to achieve their purposes by their own efforts, rather than by petitioning government or some more powerful group for favor. They can do so

through independent, non-governmental organizations of their own, which they operate, direct and finance themselves.

## Members Set Policies

The essence of farm organization is that it be democratic. In our own organization, the American Farm Bureau Federation, all activities of the officers and staff are strictly governed by the policies set down in the resolutions at the annual meeting of the national organization each year. These resolu-

tions, adopted by duly elected voting delegates from each state Farm Bureau, are based on the combined thinking of the membership at large, as developed through county and state Farm Bureau resolutions.

The work of the Farm Bureau leaders is appraised on the basis of how well they succeed in carrying out the desires of the membership as expressed in policy resolutions. The soundness of Farm Bureau policies and programs is a reflection of the sound thinking of the rank-and-file farm people which

make up the membership of the organization.

It would be a mistake to think that farmers are solely, or even primarily, concerned with the things usually designated as "farm program." Farm people, as our resolutions from year to year demonstrate, are vitally concerned with all important phases of public policy, with national and international affairs generally, with the trend and direction of our economy and our nation as a whole.

They are particularly concerned with preservation of the institutions, political, social, spiritual and economic, which together comprise the American way. As long as we have strong, courageous and democratic farm organizations, we can be assured that our heritage of freedom will have effective defenders.

## MODERN TRACTOR FARMING AT ITS BEST

WITH JOHN DEERE "M" SERIES TRACTORS AND QUIK-TATCH WORKING EQUIPMENT

How quick! How handy! That's what owners say when referring to the new speed and ease of farming with John Deere "M" and "MT" General-Purpose Tractors and their popular Quik-Tatch working tools.

The combination of the TOUCH-O-MATIC system of lifting and controlling tools and the quick, easy method of attaching tools (like the 2-row "drive-in" cultivator for the "MT" Tractor, above) represents advanced tractor farming at its best. These two features make it possible for you to spend more of your time working and less time getting ready.

And remember, when you own an "M" or "MT" you have all these advantages combined with the economy, dependability, and ease of servicing which only a John Deere 2-cylinder tractor can give you. Talk now with your John Deere dealer. Write for free literature on the tractor and tools in which you are interested.

Getting from one location to another is simple and fast with an "M" or "MT" and a John Deere Pickup Disk Harrow.

With the new center-mounted mower, you can cut 30 acres of hay in a day. Touch-o-matic controls cutter bar.

Front-end loader is one of many modern, hydraulically controlled tools, ready to save time, muscle, and money on your farm.

**M** The "M" is the John Deere Standard-Tread General-Purpose. Pulls 2-bottom plow under most conditions. Shown cultivating.

**MC** The "MC" Track-Type handles 3 plow bottoms in most conditions, brings you economical power for year-around service.

JOHN DEERE  MOLINE, ILLINOIS

A COMPLETE SYSTEM OF FARMING FOR SMALLER FARMS...IDEAL HELPER ON LARGER FARMS

"O. K. Call now. Mr. Bumphy just got into the shower again."

**ONLY**  
your railroads  
can say  
**"ALL aboard!"**

Imagine Farming Without Your Railroads, the only carriers that can handle the whole farm job... trainloads of grain and livestock, as well as thousands of carloads of fruit, vegetables and other farm products.

Yet U. S. Rails Shrink 1000 Miles a Year on the average! Why? Mainly because subsidized forms of transportation often skim away the cream of rail traffic at below-cost rates... while taxpayers (that's you and the rest of us) make up the hidden loss.

**Questions for Everyone to Think About.** Do such freight savings pay, when they're made possible only by extra taxes? And just how long can railroads stay in business to haul the bulk shipments that truck lines won't touch, and that barge lines can't handle when waterways freeze in winter?

**Your Interest as a Farmer and Taxpayer** is to encourage a sound public policy requiring all carriers to earn their way, as railroads now do. Each type of transportation will then perform the services it can handle most economically. And you'll safeguard your railroads...

# I Admire the Human Race

By  
**ROGER WILLIAM RIIS**

ADMIRE the human race. I do, indeed. Everybody is busy running us down, these days, for the mess they say we have made here and there and everywhere. Pshaw! That's short-range stuff, a worm's-eye view of our world. Over the marching and abundant centuries, we haven't made any mess. Far from it!

We have done and are doing a better job than anyone has any right to expect. We're all right!

From the beginning, we found ourselves alone in a vast universe, and not only alone but the only living thing on this planet which could realize its loneliness. We realized it, gave it a good close look, and then turned our attention to making something practical and useful out of an unprecedented situation.

First of all, we found for ourselves a Light, a God, and we got a sense of direction, a goal to work toward. This was pretty clever of us, if you think of it carefully.

We proceeded to set up standards for our living together. Early in our experience we made the revolutionary discovery that gentleness and kindness were more practical than brute strength. No other species has ever found that out and used it as a model and practical code of conduct.

We have in actual fact no one we need answer to, beyond ourselves, and yet we observe our ideal standards in remarkable degree. We are honest and trustworthy one with another so that it is the exception, it is news, when we commit a theft. We are decent 99 per cent of the time, when we could easily be vile. With silence and mystery behind us and ahead of us, we make up gay little songs and whistle them, and our feet keep jig time to them. We look life and fate in the eye, and smile. I like that, and I admire the people who do it.

Alone among all living things, we have discovered Beauty, and we cherish it, and create it for eye and ear. Alone among living things, we have the power to look at our environment and criticize it and improve it.

Finding it necessary to live together by the millions, we created for ourselves governing systems covering vast geographical spaces. Now we actually have the thrilling and terrific idea of a world government, a global government to bring justice to white and black, to Eskimo and Afrikaner, rich and poor, not because any tribe is powerful and can exact justice, but because we have conceived and created the ideal of justice and plan it for all men. This is great. This is not the act of a little animal, or a mean animal. This is possible only to a great animal. We think in global terms. We inhabit a star, and we know it.

Finding that we have to work to stay alive, we work with ability beyond imagining. Out of the earth we take food, and improve that food year by year; we take heat, and light, so that darkness which lay upon the face of the earth is dispelled by man-made light. We enjoy all the myriad products of our unparalleled ingenuity.

Every morning the necessity for the day's work faces us. And we go and do a day's work, with an overall average effectiveness and perseverance that is amazing, considering many of the jobs.

Of a persistence, a daring and ingenuity impossible to surpass, we find ways to move easily under the water and through the air. Now we speculatively eye our neighboring planets. It should astound no one if man one day begins to move among these planets. How shall I not admire such a creature? Daunted by nothing, his horizons constantly recede, the territories of his possession and use expand and expand.

Whenever he comes to an impassable obstacle, an apparently final barrier, he goes to work at it and, in due time, surpasses it. If he has limits, I do not see where they are. I do not think he has limits. I think he is a child of the universe who inherits eternity. I think he is wonderful, I am his devoted partisan, and I am proud indeed to be one of him.

# VITAMIN 1776

By WM. H. RUFFIN

President National Association of  
Manufacturers

NONE of us should any longer be surprised that there are men—like the labor leader who appeared before a Congressional committee a few weeks ago—who will stand up in public and charge that business is currently earning anywhere from 35 per cent to 62 per cent for the stockholders.

But we should be gravely disturbed that many people who hear and read

Wm. H. Ruffin

such nonsense actually believe it. We should be alarmed because when any substantial part of the public accepts such statements, it indicates that the long campaign against the profit system—the free enterprise system—has built up so much antipathy against business that people are will-

ing to believe whatever is said against it, no matter how fantastic. You and I know—and the public should be told—that if that labor leader knew where to get a 35 to 62 per cent profit he would be out begging, borrowing or hocking his union card to get in on such a bonanza.

Since economic freedom is impossible when men are deprived of the right to work in the hope and expectation of profits—since the abolition of profits means the destruction of free individual enterprise—therefore, the attacks on profits are spearheading the over-all attack on the basic freedom on which our nation is founded. Moreover, since our freedom is from God, then the strangulation of it by government is a repudiation of the nation's spiritual roots.

## Attacks Are Vicious

It is, therefore, our duty and our responsibility to arouse our fellow-citizen to the fact that these vicious attacks on profits are simply one phase—though an important one—of the whole socialist and communist campaign against all human freedom. If they can destroy our economic system by abolishing profits, then all other freedom will quickly die.

There is nothing wrong in this country today that a good stiff shot of Vitamin Seventeen Seventy-six won't cure. If the men of 1776 had left it to their professional politicians to keep us all from being destroyed, our America would not exist. The new world that Columbus discovered almost three centuries before their time

would never have had the chance to build into the land that found the way of freedom and opportunity for all independent-minded men.

Our individual American freedom rests today—as it did when it was first blueprinted for us 175 years ago—upon individual responsibility, individual integrity, individual effort, individual courage, individual thrift, and, above all, individual religious faith.

— A. A. —

## 4-H'ERS ANALYZE CITIZENS' DUTIES

"That rights of a United States citizen carry with them definite duties" was decided by a discussion group of 4-H'ers at this year's Delaware state 4-H Camp. A tally of the opinions of the boys and girls has just been released by the state 4-H Club office.

Three duties were emphasized by these youngsters. They were:

1. Vote in all public elections. They are genuinely worried about the small percentage of citizens voting in elections.

2. Believe in what we are doing, and be willing to fight for our beliefs. Almost all groups recommended more thorough study of our government and the history and traditions behind our democracy, so that we could be sure of what beliefs our nation is founded on.

3. Think of others, and learn to understand others. Seventy-five per cent of the groups emphasized the lack of racial and religious tolerance in their own communities.

Several groups said that America needed more religious faith, and more true Christians. They also felt that they as 4-H'ers had a responsibility to become better leaders in their own communities.

Said one group, "We need a wiser choice of leaders, which means a wiser choice of political candidates, regardless of race, creed, or party." Another said, "We need more attractive incentives to lure more capable leaders."

## RELY ON INGENUITY AND CREATIVE ABILITY

IF WE ARE to preserve our way of life in this country, we are going to do it not by legislation but by reliance upon the ingenuity and the creative ability of the American people.

This may be strange doctrine to the senators in Washington, many of whom think they are saving the country from day to day and from measure to measure. It may seem strange to many of you coming from me, since I have spent my life as a lawyer. But after a quarter of a century of experience in New York and Washington, I am convinced that we are not going to be saved by the legislators in Washington.

One reason that I have chosen to go into the field of Education rather than to continue with the practice of law is that I am convinced that only by proper education can America ever hope to be rescued from the false economic thinking into which she has fallen. Somehow, in some way, we must break loose from the thought that every time there is a wrong, the remedy is that of passing a law.

Laws are only effective if they represent the spirit of the people, and it is difficult to draft laws so as to preserve the creative genius of the people. They suppress and never stimulate that spirit.

—Ernest L. Wilkinson, president, Brigham Young University.

# "It's a Ford ....that's for me!"

There is no better guarantee of the soundness of your tractor investment than a good name.

That's the best reason we know for choosing a Ford Tractor. What other name in all American business has meant so much, for so long, to grandfather, father and son . . . on so many American farms?

More than the name of a car, truck or tractor, "Ford" is a trusted friend—has stood through the years for honest quality at a rock-bottom price.

Today's Ford Tractor is an outstanding example of what the Ford name can mean in practical, multi-purpose farming help . . . in engineering leadership . . . in low price. Sturdy and amply powerful for most field jobs, it's a chore-job tractor, too. And the Ford Tractor sells for \$50 to \$500 less than other two-plow tractors with comparable equipment in most farm communities.

Yes, "Ford" means more in tractors, too! Ask your nearby Ford Tractor dealer to demonstrate its full meaning to you!

# No Accident!

By **BENJAMIN F. FAIRLESS**  
 President, United States Steel Corporation

**E**VER since the invention of gunpowder, man has possessed the means of destroying himself collectively. But after seven centuries of prodigious effort, he has not yet succeeded in doing so. I am firmly convinced he will not do so now. And if subsequent events should prove me wrong, at least I shall have one consolation. No one will ever be able to say: "I told you so."

The most devastating commentary upon the stupidity of man perhaps is the fact that history does repeat itself. The great civilizations of the past have risen in nation after nation to a pinnacle of glory, and have crumbled away again into the dust. They were not destroyed from without by an atomic bomb. They were destroyed mostly from within, by decay and rot and greed and infamy.

Our American civilization is no accident. It exists because it was founded squarely upon the concept of human liberty. It exists because we have learned to defend the rights of the individual and to respect the dignity of man.

## Chasing Rainbows

But for many years now, we have been surrendering these God-given rights, bit by bit, in the search for an even better way of life. Instead of striking out for ourselves, along the path of freedom, we have chosen instead to follow slowly, but steadily, in the despairing footsteps of Europe, even though there can no longer be any doubt that the road ahead will lead us into economic and political slavery.

Whether to abandon that road now, while there is still time, or whether to permit human liberty to perish from its last great refuge on this earth, is the most critical decision that this nation has faced since 1776. And if I read the signs correctly, the responsibility for making that decision is going to fall primarily upon the young men and women of this generation.

You are citizens—free and twenty-one. The President of the United States, the members of Congress, and a couple of million Federal employees are your servants. You have the power. But where do you go from here? How do you plan to succeed where all others have failed?

It seems to me that if you are to avoid repeating or perpetuating the mistakes of my generation, you ought at least to know what they were, and why we made them. Now I suppose that if we attempted to find one single word which in its broadest sense would best describe all the aspirations and the hopes of my generation, that word would be "security." And I do not mean "economic security"

alone, for there are many other kinds. Of most immediate importance to all of us today, probably, is the physical security which can be attained only by banishing war from the earth forever. It can best be described as World Peace.

## Mind Over Matter

The greatest security of all, of course, is spiritual security—an un-failing faith in the benevolence of God. It might be described as Peace of Mind; for security—above all else—is a mental condition.

The most unusual security on earth—and the one which we take most for granted—is political security. It is the right of free men to control their own government and to enlarge or diminish its powers at will. We call that Human Liberty.

So take these four kinds of security—economic, physical, spiritual and political—bundle them all together, and you will find, I think, that they fairly represent the goal toward which every generation has been striving over the centuries.

But in our attempt to establish security on a collective basis, as a pillar of good government, we made one serious error right at the start. We concentrated so heavily on the search for the economic

variety that we badly neglected the other three. We did not seem to realize that unless we possessed them all, we had no real security whatever.

## Security Through Slavery

Yet we should have known better, because there was in this country—a century ago—a widely-established system of economic security under which large numbers of our people were guaranteed work, food, clothing, shelter and all the basic necessities of life from the cradle to the grave. But that system was abolished. You see, we called it "Slavery."

And there we had—right before our eyes—the perfect example of the ultimate misery which results when economic security is purchased at the expense of human freedom.

So, of my generation, it may be said that we scored the greatest scientific and industrial advances of all time, and that we created—for all of our people—more economic wealth than any other generation ever had. And that was good.

## Elusive Peace

It must also be said, however, that our material progress vastly outstripped our spiritual development; that we permitted some of our precious liberties to be taken from us without voicing even an effective protest; and that—in common with all the genera-

Lincoln's Gettysburg address contains 266 words.

The Ten Commandments contain 297 words.

The Declaration of Independence contains 300 words.

The OPS order to reduce the price of cabbage contains 26,911 words.

tions before us—we failed to achieve world peace. And that was bad.

Today, I do not believe that the people of any nation on earth want war; but they will have little voice in the matter. The final decision will be made by the Government in the Kremlin.

\* \* \*

Of all the mistakes that my generation has made, however, the greatest, probably, was in the field of spiritual and political security.

For nearly twenty years we have been told that the laws which were made by our forefathers, and the principles which they established 175 years ago, have become obsolete. We were told that those fundamental laws cannot be expected to apply to the complex and difficult problems which we face in this modern industrial age. We were told that the time had come when we had to adopt new ideas and new principles.

### Truth Never Changes

Now that sounded so logical — and so perfectly reasonable—that we fell for it, hook, line and sinker. We didn't stop to think that the laws of navigation are centuries old, yet they still apply to airplanes just as well as ships. A thousand years ago men reckoned in dozens what they now compute in billions, but the laws of mathematics remain immutable. And so do the laws of physics . . . and of chemistry . . . and God.

Ever since Moses came down from the mountain, the Ten Commandments have been the basic laws of civilized men. They are the laws upon which this nation was founded; and they are as inexorable today as they were in the days of the Pharaohs. But that never occurred to us. We had to have change for the sake of change—so we set up new laws and new principles.

### Legalized Theft

We began to repeal the Ten Commandments starting with the one which says: "Thou shalt not covet." And—since we had no legal right to steal from our neighbor the things that we

coveted — we empowered the Government to do it for us. That we could not legally confer upon the Government a power which we did not morally possess never bothered us a bit.

So we went merrily along our way, redistributing the wealth—but not necessarily on the basis of need nor always to the children of misfortune. The controlling factor in most cases was the ability of the recipients to deliver a bloc vote at the polls.

### True Security

To find that better life and to build that better world is the compelling task that now confronts you. Where we failed, you must—and will—succeed. But if you will study the mistakes of my generation carefully, I think you will see that we have made one great contribution after all: We have proved conclusively that true security can never be fashioned out of slavery, injustice and corruption. It must be founded firmly on the laws of God, and dedicated wholly to the dignity of man.

In short, if I could sum up in a single sentence the lessons we have learned from the unhappy experience of nations all over the world, that sentence would be this: There is no security without freedom; there is no hope without opportunity; and there is no progress without incentive.

The job ahead of you is difficult; but it is urgent and rewarding. We of my generation will watch your progress eagerly—with faith in your ability to succeed; with hope for the great future you will build, and with charity towards the mistakes you will make.

And as my own contribution to this effort, I would like to offer you a little prayer which I hope will prove as helpful to you as it has to me on occasion. I do not recall where I found it, nor who wrote it, and perhaps I do not have the wording exactly right, but the gist of it is this:

"God give me the patience to accept that which cannot be changed.  
"Give me the courage to change that which can and should be changed.  
"And, above all, give me the wisdom to know which is which."

# Farmers List Problems

By C. KENNETH BULLOCK

**D**URING the month of August the New York State Farm Bureau Federation and Extension Service held a series of ten regional meetings over the state for members of County Farm Bureau executive committees, county delegates and county agents. One of the most interesting parts of these meetings was a discussion and listing of what those attending considered to be the most important public problems of farming.

### Waste

A total of 27 problems was recorded at these meetings, not counting duplications. These were sent by the Federation to all County Farm Bureaus asking them to select the five that they think to be most important. At this writing the problem getting the greatest number of votes is that of "unnecessary government spending."

Farmers pointed out at the meetings that there has been a continuing increase in the cost of government over a period of a great many years, considerable of which is caused by inefficiency and waste; that spending for non-defense is too high and that there is need for a balanced federal budget. They also stated that the high taxes incident to high government spending place farmers in a squeeze on the cost of items they have to purchase. It was apparent that many farmers are willing to take the leadership and set an example for other groups in promoting a reduction of unnecessary government spending.

Discussions of this problem were not limited to spending by the federal government. It was pointed out that the cost of operating the state, county and local governments is on the increase too.

### Controls

"Too much government control" was ranked as the second important public problem. Farmers attending these meetings expressed alarm over socialistic trends and centralization of power in the federal government. They felt that there is a trend toward government becoming master of the people rather than a servant of the people. They want to keep government out of farming and avoid government programs which have control features attached to them. They expressed opposition to price and wage controls, said such controls would not allow maximum production and therefore are not in the public interest. Above all, they don't want subsidies in lieu of a fair price in the market place.

A third problem is the "lowering of

moral standards in our country and in government." Farmers at these meetings cited the lack of interest by the general public in good government, the need for honesty in government and the need for more able, honest and intelligent leadership in government.

### Public Relations

"The need for better public relations" was listed as the next most important problem. It was stated that farmers are at a low ebb in public relations, particularly with consumers, which is due to a considerable extent to unrealistic government programs such as those supporting the prices of potatoes and eggs.

It was under the potato program that the better potatoes were sold to the government for cattle feed, alcohol and for destruction, while only the poorer potatoes found their way to housewives. There was much publicity on both the potato and egg programs which resulted in consumer antipathy. It was pointed out at the meetings that there is great need for consumer education in the cost of food production, need for better relations with other groups and agencies and a more practical reporting of prices received for their products.

### Inflation

Another problem considered by County Farm Bureaus to be high on the list is the control of inflation and, along with periods of deflation, its detrimental effect on farming and our economy as a whole. It was also pointed out that there is need for a stable monetary system to lessen the sharp ups and downs of inflation and deflation.

The need for maintaining strong farm organizations was cited as an important problem and received a substantial number of votes, for without such organizations farmers are powerless to attack aggressively and effectively the public problems enumerated here. Strong, vigorous organizations are needed as a voice for farmers in helping determine not only farm policies, but all public policies. It was pointed out that agriculture needs strong leadership to hold its position in the face of great odds, for in New York State there is only one farmer for every 19 other persons.

Other important problems discussed and receiving some votes by County Farm Bureaus are: international situation; better marketing and distribution; getting people to think for themselves by taking part in local affairs; and availability of farm labor.

The finalists in the young farmers' "talk meet" at the New York State Farm Bureau Federation. From left to right: Robert Jenks of Bainbridge who won first place and will represent New York at a similar contest at the American Farm Bureau Federation meeting in Chicago; Paul Hoepner of Worcester, second place; Harry Goldschmidt of Windsor, third place, and David Ross of Westfield, fourth place.

The contestants knew that the general subject would be in the field of "Aid to Europe," but they did not know what phase of this subject they were to be asked to talk upon until 30 minutes before the contest. This was a contest in extemporaneous speaking.

## Paying a Profit

"We expect our equipment to pay us a profit," say George S. Hitchner & Son, owners of this Bridgeton, N.J. farm, "and we buy it on that basis. We bought a Craine Nurok tile stave silo for our new dairy barn because we know it will make for profitable feeding—now and for years to come."

We're mighty proud of this statement, by one of famed Cumberland County's outstanding farmers. It's a typical reaction. Dairy men everywhere have come to realize that a silo is an investment in good feeding—and they're insisting on Craine, the best investment!

No matter what your feeding program, there's a Craine that will do the job most profitably.

# CRAINE SILOS

Ruth E. Ashline, RI, Hartland, Vt.

Feed costs high? You are darn right they are! So do as other successful dairymen do—promote vigorous, constant appetite and efficient feed-to-milk conversion by adding concentrated Kow-Kare. Prevent sluggishness. Step up production. Kow-Kare's Tonic Drugs, Iron, Iodine, Cobalt, Calcium, Phosphorous and Vitamin D promote cow health, save feed waste, cut down disorders. Ask for Kow-Kare at all stores—three sizes.

## Immorality Has a Source

By SEN. HARRY F. BYRD

OUR great freedom heritage is the Constitution of the United States. And we have every reason to consider the American system of free enterprise as the world's greatest deterrent to world conflict. Our productive system is a more dependable guardian of peace than the United Nations ever will be. It is the only force in the world that Russia recognizes and fears. It is a creature of democracy. Neither democracy nor our free enterprise system can survive its insolvency.

In recent years there have been giveaway programs on top of giveaway programs, by which the government

Not only does bureaucracy pad its payroll but the various agencies of government spend an estimated \$100 million a year on propaganda for a great variety of projects that in the aggregate run into many billion dollars annually. Our public servants have become the most vigorous and dangerous lobbyists for the spending of public money at a time when our Federal finances are in the danger zone. — *New England Letter, The First National Bank of Boston.*

has been taking money from people, giving them back less than it took, and in the process making them think they are getting something for nothing. Through these programs we have gradually centralized power in a gigantic sprawling bureaucracy which is just too big to audit. This centralization of power in Washington is still increasing. The President is constantly asking for more and more power to be taken from the states, from the localities and from the source of all power—the people.

## Immorality's Breeding Grounds

Actually it is difficult to determine whether these continual attacks on our constitutional institutions and fiscal responsibility have bred immorality in high places or whether the immorality in high places has brought about the attacks upon our institutions.

It is unnecessary to go through all the revelations of the RFC investigations; the five-percenters investigation; the situation in which the army officer said he was "just one who got caught;" the patronage peddling in Mississippi; the revelations of the Crime Committee and the tie-ups between government activities and the underworld.

A code of political ethics has been proposed. But if the time has come in America when we must pass a law and appoint a commission to establish a code of ethics to tell public servants they should be honest, to tell public servants they should be loyal to their government, to tell public servants they should not barter public trust for greedy personal profit—if the time has come when Congress has to set up a commission to rewrite the Ten Commandments with special applications to political opportunists, then the basic virtues of our form of government have been crucified. — *The Harding College Letter.*

(Senator Harry F. Byrd of Virginia is probably the best informed man in Congress on fiscal affairs of the federal government. In Congress he has distinguished himself by studiously applying his fine integrity, intellect and energy to some of the most disagreeable tasks of a Senator, and by a constant use of an unusual degree of foresight.—*Geo. S. Benson*)

## A Lesson In SOCIALISM

AS A TEACHER in the public schools, I find that the socialist-communist idea of taking "from each according to his ability" and giving "to each according to his need" is now generally accepted without question by most of our pupils. In an effort to explain the fallacy in this theory, I sometimes try this approach with my pupils:

When one of the brighter or harder-working pupils makes a grade of 95 on a test, I suggest that I take away 20 points and give them to a student who has made only 55 points on his test. Thus each would contribute according to his ability and—since both would have a passing mark—each would receive according to his need. After I have juggled the grades of all the other pupils in this fashion, the result is usually a "common ownership" grade of between 75 and 80—the minimum needed for passing, or for survival. Then I speculate with the pupils as to the probable results if I actually used the socialistic theory for grading papers.

First, the highly productive pupils—and they are always a minority in school as well as in life—would soon lose all incentive for producing. Why strive to make a high grade if part of it is taken from you by "authority" and given to someone else?

Second, the less productive pupils—a majority in school as elsewhere—would, for a time, be relieved of the necessity to study or to produce. This socialist-communist system would continue until the high producers had sunk—or had been driven down—to the level of the low producers. At that point, in order for anyone to survive, the "authority" would have no alternative but to begin a system of compulsory labor and punishments against even the low producers. They, of course, would then complain bitterly, but without understanding.

Finally I return the discussion to the ideas of freedom and enterprise—the market economy—where each person has freedom of choice and is responsible for his own decisions and welfare.

Gratifyingly enough, most of my pupils then understand what I mean when I explain that socialism—even in a democracy—will eventually result in a living-death for all except the "authorities" and a few of their favorite lackeys.  
— Thomas J. Shelly, Yonkers High School, Yonkers, New York.

— A.A. —

### EMOTIONAL MATURITY

IN A recent address Dr. Edward A. Strecker of the Pennsylvania School of Medicine, presented the following analysis of emotional maturity:

1. Sticking to a job until it is completed or until one has given all one has in the effort.
2. Giving more than is asked in any situation. This is regarded as basic to "reliability."
3. Persisting in the face of difficulty.
4. Having the ability to endure unpleasantness, discomforts, frustrations or other hardships.
5. Being able to "size things up," make one's own decisions, or, in short, to show a marked degree of independence.
6. Determining to achieve, to succeed; the will to live.
7. Having the capacity to co-operate, to work in an organization under authority.
8. Possessing flexibility; a person who can adjust to time, to other persons and new circumstances.

Dr. Strecker concluded his public address by saying: "The attainment of emotional security is important not only for the individual but also, I think, upon it depends the survival of our democracy."—From the Telco News.

## One Out of Every Nine

From the Congressional Record

HOWARD BUFFETT, Congressman from Omaha, informs the House of Representatives that 17,665,783 individuals now receive regular monthly remittance checks from the federal government. The corresponding number on June 30, 1932, was 2,196,151. There is a rich harvest of votes in the 17 million monthly remittances.

Here is the list of remittance individuals compiled as of July 1, 1951, by Congressman Buffett, from official Treasury reports:

Federal civilian workers	2,409,121
Federal retired workers	166,081
Old-age assistance	2,766,866
Dependent children	1,639,107
Federal aid to blind	95,521
Disabled children	70,745
Public assistance	418,000
Old-age pensions	3,605,235
Veterans' pensions	2,368,238
Veterans' dependents	658,123
Military personnel	3,300,000
Retired military pensions	135,923
Coast Guard personnel	26,498
Coast Guard pensions	6,325

Total ..... 17,665,783

Congressman Buffett says: "These figures do not include various large

groups receiving what are classed as temporary monthly payments from the Government. For example, in the fiscal year 1950, more than two million veterans received monthly checks for vocational rehabilitation and readjustment payments. Those two million checks each month are not included in my tabulation.

"In June 1951 almost one million workers were receiving semi-monthly unemployment checks from the federal government in the various states. Also, the army of Agricultural Adjustment Administration part-time workers, plus 2,282,000 farmers who got crop adjustment checks in 1950-51, are not included.

"The 17,665,783 total represents only those persons who get a regular check each month from the U. S. Treasury for services rendered—or not rendered. This carefully calculated total represents, roughly, one out of every nine persons in our entire population.

"And let us never forget that this monthly payroll has been multiplied by nine during the last 19 years. How long can give-away government last at this rate of expansion?"—Reprinted by permission of Readers' Digest.

## PENSTIX®-SM HELP SOLVE DAIRYMAN'S BIGGEST PROBLEM

MARION, IOWA—Harry Simonsen, manager of the Witmer farms located near this Iowa town, and chief herdsman Chester Bullis (pictured above) like to use Wyeth's Penstix-SM bougies for mastitis in their cows, for several reasons.

"First," says Mr. Simonsen, "Penstix-SM are easy to use... can be quickly inserted into the affected quarter when signs of mastitis appear. Then, too, Wyeth's Penstix-SM are handy to keep, with no refrigeration required."

Chief herdsman Bullis, of the Witmer Holsteins, backs up Mr. Simonsen's statement. "It's easy for the men working here to use Penstix-SM. Takes no preparation and we can keep a supply right in the milking room. We like the double-barrelled action Penstix-SM gives us," Mr. Bullis adds. "Penstix-SM act fast. Those two antibiotics certainly go to work to give real results."

## Let's Buy Our Own LIME

I BELIEVE that in the USDA we have built a Frankenstein monster that may destroy us. I agree with Walter Berger, president of Feed Manufacturers Association of Chicago, that 50 per cent of the USDA could be laid off and service would be cut only 15 per cent, and I feel that now during the war effort is the time to do it. Many other non-military departments in Washington could probably be cut more.

I am ashamed to admit it but I have been accepting government lime, delivered and spread on my farm for years. One year I did not sign up, so I was visited and sold the idea that everybody else did it and I was helping pay for it and was a sucker if I didn't get mine. In the future, couldn't mine be spread at night so my friends working for wages in town and helping pay for it would not see me doing it?

We all want lower taxes but none of us want our own private little racket bothered. Why not stop all this nonsense and buy our own lime, dig our own ditches, cut our own brush and let the money saved help build the largest and best Navy and Air Force before it is too late. "Uncle Joe" likes our farms. We don't want him—nor do we want to be taken over by a smoother method that will have the same ultimate end.

The only justification for all the government farm program is caused by the farmer's lack of ability or legal right to organize. I attended a meeting in New York City where some hatcherymen were discussing the advisability of agreeing on a fair price for their chicks. A representative of the USDA told them that if they did, they would be open to prosecution by the Department of Justice for violating the Anti-Trust Law. Yet organized labor has this right and we have to live with it.

I operate one of the larger poultry farms in the state with about 12,000 breeders supplying hatching eggs to Delmarva. I also have one of the larger mortgages on the farm. I do not expect to die right away but when I do I should like to leave the place to my children with no mortgage on the land, or what is more important, one on their souls, held by a socialistic government doling out handouts occasionally to keep them quiet.

—Arthur E. Prosser, Chester, N. Y.

### 4-A Winners

At the recent annual meeting of the Dairymen's League, Editor Ed Eastman of AMERICAN AGRICULTURIST presented American Agriculturist Achievement Awards to the two young people shown above.

At the left is Elizabeth Mary White of Chaumont, New York. She has been an outstanding leader of the Young Cooperatives and is a winner of the Babe Ruth Foundation Medal for sportsmanship, leadership, and scholarship. At the right is Vernon Wahl of Callicoon, New York, who was a junior delegate to the League meeting. He helped to start a Young Cooperators group and is now operating a 98-acre farm with 38 Holsteins.

## It was His Own Idea

GUY R. BEARDSLEE, West Point graduate, served his country as an Indian fighter. But it was when he settled down on his farm near St. Johnsville, N. Y., that he made history. There, he pioneered in an undertaking that required unusual initiative, enterprise and faith.

In 1898, Beardslee invested his capital in a new-fangled electric generating plant, powered by the creek which ran through his farm. Two years later, he expanded, building 4½ miles of line to serve his farm neighbors. Right there was the beginning of farm electrification in New York State. From this one simple act of private initiative stemmed great advances in farm life, the introduction of comforts and leisure never known on the farm before.

The Niagara Mohawk Power System grew from many small enterprises, including Guy Beardslee's pioneer company. Today, Niagara Mohawk serves over 63,000 farms, and its rural lines are long enough to cross the country eight times. The average Niagara Mohawk farm customer uses twice as much electricity as he did ten years ago. During that time, many necessities of life have doubled in price, but the average cost of electricity to the System's farm customers has gone down 41%.

The Niagara Mohawk System is a striking example of what private enterprise and initiative can accomplish. Its growth from small beginnings typifies the pattern that has made America great.

## Empire Congratulates

# The American Agriculturist On Its Fight To Maintain Our Personal Liberties

Empire believes the **AMERICAN AGRICULTURIST** is to be congratulated on its Annual Editions which join business and agriculture in an effort to preserve personal liberties and to maintain the free enterprise system of farming and doing business.

Throughout the year, the AMERICAN AGRICULTURIST fearlessly crusades for free markets and free competitive enterprise as cornerstones of a free economy and of individual freedom.

## Empire's Purpose

Empire Livestock Marketing Cooperative was founded by the farm organizations of the Northeast to provide farmers in New York with a chance to determine where and how to market their livestock. Before Empire, many farmers had only one market for their livestock. Market reports for local areas were not available. Today, Empire strives to keep livestock producers informed as to market prices and market trends through fast, accurate market reporting. Empire's seven markets are strategically located across New York State so that practically every farmer can use the facilities.

Farmers now have a chance to study market reports and decide where, when and how to market their livestock. Empire Stockyards are open to anyone. Selling is done by competitive bidding. The livestock producer through Empire's efforts now has a chance to express a choice in marketing his livestock, and the personal liberties of New York's livestock producers have been increased.

# Again we say . . .

“YOU cannot bring about prosperity by discouraging thrift. You cannot strengthen the weak by weakening the strong. You cannot help the wage earner by pulling down the wage payer. You cannot further the brotherhood of man by encouraging class hatred. You cannot help the poor by destroying the rich. You cannot establish sound security on borrowed money. You cannot keep out of trouble by spending more than you earn. You cannot build character and courage by taking away man’s initiative and independence. You cannot help men permanently by doing for them what they could and should do for themselves.” —*Abraham Lincoln*

*Planned Action Will*  
**GET RESULTS**

By HUGH COSLINE

**I** WOULD like to see seven fundamental facts posted in every schoolroom in America and in every public place where people congregate. I would like to see these facts presented to all citizens so often and so forcefully that they can never be forgotten. These facts are:

1. America is great because its people have been free.
2. Before necessities and luxuries can be used they must be produced.
3. The government has nothing to give anyone except what it first takes away.
4. The- government which governs least governs best.
5. Thrift, honesty and reverence will never become old fashioned.
6. Education, which has been well defined as learning responsibilities, is essential to democracy.
7. If we expect to remain free we must exercise our responsibilities as citizens.

I would like to comment briefly on each of these. First, **America is great because its people have been free.** Various reasons have been given for the greatness of America. Some say it is due to our natural resources. Some say it is because of our superior brains. If we are honest we must admit that some backward countries have natural resources equal to ours and that citizens of some other lands are as intelligent and have training equal to ours. The only fair conclusion after studying all the facts is that this country is great because its citizens have been unhindered by many of the restrictions that have shackled the people of other and older countries.

## Thrifty Are Penalized

In recent years we have seen a tremendous shift in thinking toward the socialistic idea of "giving according to need and taxing according to ability to pay." This penalizes the thrifty and rewards the slothful, and leads inevitably to Totalitarianism where the individual lives for and serves the state rather than where the government serves the individual. Nothing ever thought of by man is so effective in stifling initiative and progress.

No true American wants Totalitarian government here, but too many of us have been holding on to the benefits of freedom with one hand while reaching for a mirage—the fanciful and supposed benefits of socialism.

**Necessities and luxuries must be produced before they can be consumed.** We think a great deal about money which, after all, is only a medium of exchange and cannot be eaten, worn, or burned to keep us warm. Our standard of living about which some of the planners worry so much, depends on production followed by equitable distribution.

The government has nothing to give except what it first takes from someone. The big danger with government handouts of any sort is that they create pressure groups, each of which wants as many subsidies or more than other groups. Subsidies give the false illusion of "something for nothing." We almost thank the tax collector for taking our money from one pocket, using half of it to administer a "program" and putting what's left in our other pocket.

The government which governs least governs best. The simplest form in which I have heard this expressed was set forth by the late Dr. George Warren when he said, "The individual should do all he can for himself. Groups of individuals, cooperating, should do all

possible that the individual can't do. The local government should do only what individuals or groups can't do. State governments should do what local government can't do and the federal government only what cannot be done by state and local governments."

We have only to look back to the founding of this country to see that our forefathers had healthy fears of government. This is why they created three equal divisions with checks and balances on each. Because in early years our leaders were statesmen before they were politicians, much of that fear of government was gradually lost.

In recent years during so-called emergencies we have handed more and more powers to government; foolishly believing that they would be exercised for the good of all rather than for the benefit of political parties and office holders, and that they would be readily handed back to the people when the emergency was over.

**Thrift, honesty and reverence will never become old fashioned.** We hear continually that we are in a new trend and that we mustn't be old fashioned. America has never been old fashioned, its citizens have ever been willing to try new things to a degree never matched before. But the time has not yet come when we, either individuals or governments, can spend ourselves into prosperity.

No people can govern themselves unless they know the importance of spiritual values, the necessity for hard work and thrift, and the futility of expecting something for nothing. To understand these things they must know something of man's history, some basic economic facts and must be able to exercise their reason, thereby weighing the false promises made by demagogues whose ambition is to rule by force.

If we expect to remain free we must exercise certain responsibilities.

It is my firm conviction that we have not yet gone down the road toward socialism so far that we cannot retrace our steps. It is also my conviction that we are further along that road than many of us realize.

What can be done to reverse the trend to socialism which we have been following? Democracy will not run itself. It has great values but the price is higher than many of us have thought. Too many citizens think the present trend toward socialism is correct—or perhaps they do not think at all. Too many of those who believe something should be done throw up their hands and say, "What can you do? We are in a trend and we will only butt our heads against a stone

(Continued from Opposite Page)

wall if we oppose it." Some oppose the trend and work against it. I belong to that group.

Here is what I think should and must be done:

① We must decide what we want. We cannot have a government that is paternalistic toward one group, be it farming, labor or industry, without getting paternalism for all groups. Too many individuals and groups want more than a fair share of the good things of life. Too many want to eat their cake and still have it. Do we want free enterprise and freedom or do we want socialism without freedom? There is no middle course.

② More people must be convinced of the absolute necessity of action. That is where you and I come in. Plenty of action has come from government; our money has been used to sell us "a bill of goods." The real and imaginary evils of free enterprise have been pointed out on every occasion. Because there are shortcomings, the inference is that the capitalistic system should be scrapped for some idealistic system with no record of successful application. Government has eagerly grasped the opportunity to do for us what we should do for ourselves and has even suggested more and more ways it could be helpful — all with our own money of course.

③ We must refrain from asking government to do those things we should do for ourselves, and we must resist such requests from other groups. We must tell government in no uncertain terms that we are determined to stop government from doing for us some things we have mistakenly asked for as well as some things we never even suggested.

④ More of us must vote. Nothing pleases a corrupt political machine as much as a light vote. It is not enough to vote blindly, but blindly voting a straight party ticket is far better than not voting at all.

⑤ We must secure able and honest candidates. We can be most effective in working for able candidates for local government because we know most about them. Doing that will automatically help to choose better candidates for state and national positions.

⑥ We must accept office when it comes to us. It is so easy for a good man to say that he is too busy or that he is not interested in politics, but if good men will not accept, those not-so-good will be very happy to grasp the opportunity.

⑦ We must let legislators and public servants know what we want. Do not make the mistake of believing that letters, post cards, or telegrams are ineffective. Personal letters are tremendously effective, especially if plenty of them are in substantial agreement.

⑧ We must support the legislators who support freedom. Too often the congressman who offends a pressure group stays home after the next election. Every person whom he has offended goes to the polls to vote and brings all his relatives, while the person who benefits goes hunting on Election Day.

⑨ Finally, be alert to the news and developments from day to day. Be from Missouri. Question what you hear and read. Challenge statements derogatory to Democracy or favorable to State Socialism. With every means at your command, foster and encourage an alert, aroused and aggressive citizenry determined to be free.

There is nothing new about the program I have outlined. It is the identical program that has made democracy work in the past, and it is a program which will be effective now if a majority of our citizens will try it.

# Cooperation Wins

## TO BENEFIT ALL

THE METROPOLITAN COOPERATIVE MILK PRODUCERS' BARGAINING AGENCY, INC., is an organization of 57 milk cooperatives servicing the New York City market.

These agency cooperatives have a total producer membership of more than 24,000.

The Bargaining Agency's job is to represent milk producers in the New York milkshed and to see to it that they get a price for milk in line with wages of labor, prices of things farmers buy and the cost of producing milk. The milk price policies of the agency are exclusively the authority and the responsibility of the 57 delegates. There is one delegate from each cooperative member in the agency.

An outstanding example of the Bargaining Agency's success in the milk pricing field is the New York Class I-A Price Formula. This formula is an escalator for milk prices. Starting with \$5.66, the average price for the year 1948, the price goes up or down as the Index of United States Wholesale prices moves. Then the price is further adjusted in accordance with the supply of milk in relation to the demand for fluid milk. Finally, the price of milk must not get too far out of line with the Index of Cost of Production.

The adoption of the New York Milk Price formula was the direct result of the quiet but firm insistence of the Bargaining Agency that: The price of Class I-A milk in the New York market must be based, not on the price of butter or any other manufactured milk product, but on local economic conditions and cost of milk production in the New York milkshed.

The Bargaining Agency is the only organization upon which you can rely for an intelligent and fair price for your milk.

*If you are an unorganized milk producer, we urge you to get your group together to form a cooperative and become part of the Bargaining Agency. If you need help, write us for assistance.*

## Animal Behavior Shames Man

By J. F. "Doc" ROBERTS

**Y**OU and I have many friends who, all through the years, have maintained their personal liberties and at the same time have been tremendously productive to both business and agriculture. They have shown an outstanding tenacity of purpose in their responsibility to their families and to others, their surroundings, their homes and towards themselves. This must be pleasing to their God.

Yes, our animals (even our so-called wild animals) have never surrendered their liberties nor have they stopped producing wealth for others or for themselves. Have you ever thought of how they were able to do this while under domestication or while they were in the wild state? In many cases they have had to eat one another in order to exist. What has been God's plan in regard to them? You never heard of all the lions ganging up and killing all the tigers or tigers destroying all the deer. We still have little cottontail rabbits and song sparrows. Respect for personal liberties on the one hand and a willingness to fight for and protect liberties on the other must be their God's plan or we would have no so-called animals left in this world.

This may sound over-drawn but many of us do get to thinking when we see bulls fight to protect their liberties with their herd or for the herd, and when we see rams fight each other and everything, including ourselves, to protect their flock and then see defenseless ewes stomp and struggle to save their lambs or cows fight to protect their calves. Particularly do these things make an impression on us when

J. F. "Doc" Roberts

we are able to see the end results of those fights and struggles. Never have any of us seen a herd of bulls or rams go over the fence and gang up on another herd of rams or bulls.

On the pleasanter side, how many times have we seen our own farm dogs protect our own farm cats against intruders of any kind? Is there anything more zealous over its liberties than a cat or a dog? Yet they live side by side in perfect contempt of each other. Last winter we had two cats and two dogs living with us. Before going to bed we would put all four out for a while. When we came to let them in, if they were not all at the door, our old Newfoundland dog would wait and refuse to come in until all the others had come. Yet in the spring, summer and fall, he would not deign to notice any of them. Many of you have experienced this sort of thing. Our dogs are not fighters; other dogs go by or go on the neighbor's land and nothing happens, but let one of them step foot on our land and all h--- breaks loose. How do those dogs know where their liberties begin and end?

### Respect Others

These same dogs and cats (and there is nothing new about this) eat at the same time but on different plates. The big dog never goes near the little dog's plate until he leaves it, or the cat's, or vice versa. Where did they get the idea of rights, privileges and respect for the liberties of others?

How many times have we all put a new animal in a flock or herd and watched the commotion this brought about until that new animal was accepted or rejected? Twice in my experience have I seen an animal rejected by its kind, and only twice. Both times the rejected animal proved to be a worthless no-account to man or beast.

One example was a saddle horse that

(Continued on Page 39)

## The Right to Be Wrong

By ADMIRAL BEN MOREELL

**I**T MUST be obvious that liberty necessarily means freedom to choose foolishly as well as wisely; freedom to choose evil as well as good; freedom to enjoy the rewards of good judgment, and freedom to suffer the penalties of bad judgment. If this is not true, the word "freedom" has no meaning. Yet there are persons in America who wish to pass laws to force people to do only "good," or at least their concept of what is good.

These proposed laws are frequently justified on the ground that there are physical and mental inequalities in the world; that those inequalities result in economic inequalities; and that the primary function of government is to pass laws that will tend to equalize such inequalities. Is not this concept of government a rather brazen indictment of God? Is not this an acceptance of the communistic theory of using force to take "from each according to his abilities" and to give "to each according to his needs?"

### Equality by Law

Unfortunately there are many persons in the world who hate variations and inequalities, who admire the type of society developed by the ants and bees. These people see that variation among human beings has allowed one person to produce more than another, with resulting differences in material possessions and comforts. And then these self-appointed supervisors of hu-

man destiny, who cannot tolerate variation, begin to agitate for a law to take away from the high producer and give to the low producer.

### Enemies Of Liberty

I am willing to concede that the do-gooder may have the best intentions in the world. But it cannot be denied that the laws he proposes always involve more government, more government ownership and operation of the means of production, more government interferences in the distribution of what individuals have produced, more power for government and less freedom of choice for individuals. I hold that the people who advocate these positive laws against freedom of choice are knowingly or unknowingly—the enemies of freedom and progress.

Against the background of my many years of service in the Navy, I make this declaration: I do not fear the Russian Army, or the atom bomb, or the hydrogen bomb, nearly so much as I fear this concept of using the law to relieve individuals of the responsibility for their own welfare and to deprive them of their freedom of choice. We can all see the danger of a military threat to our freedom. If we are attacked we will fight, and we will win! But few of us appear to understand this insidious process whereby we use our own laws and our own government to destroy our own liberties just as surely as if some foreign conqueror had power over us.

## IDLE HORSE-POWER EATS CASH!

We say machine power beats muscle power because motors don't eat when they're not working, but it's not strictly true—engines that are idle are eating your cash through depreciation and through the cash they tie up.

Let us show you how one engine—the power plant of your SEAMAN Tiller—will build production on your farm through better tillage and land reclamation, and by delivering the belt horsepower you can use for more productive farming. Plenty of power in Tiller engines for irrigation too.

# Let Farm Organizations SPEAK FOR FARMERS

ROGER FLEMING, executive secretary of the American Farm Bureau Federation, speaking at the 36th Annual Session of the New York State Farm Bureau Federation traced the growth of attempts by government to develop a planned agriculture. He reminded listeners that three groups — business, labor unions, and government—would like to speak for agriculture to tell Congress and the world what farmers want and need. For this reason it is extremely unlikely that any one of the three will give enthusiastic support to a hard-hitting farmer-controlled organization like the AFBF.

Mr. Fleming expressed the opinion that the Farm Family Policy Review, which he characterized as the latest chapter in the story of attempted controls, was a type of activity which the U. S. Department of Agriculture has no business fostering. The fact, he said, that the stated object of the meetings was "to get the real opinion of farmers" was a direct slap at all farmer-controlled organizations, the insinuation being that the real opinion could not be secured from them.

At the joint banquet of the Farm Home and 4-H Federations, Howard Kershner, editor of *Christian Economics*, spoke on "God, Gold and Government." He told the importance of morality and ethics, sound money, and honest government in reversing the present trend which he characterized as headed toward government bankruptcy. After the banquet, some thought was expressed that his comments about the gold standard were in opposition to the late George Warren's commodity dollar. As a matter of fact, there was no conflict. Dr. Warren proposed a dollar backed by a changing amount of gold, depending on changes in the price level. He did not advocate abandoning the gold standard. Mr. Kershner emphasized that without a gold standard there is no brake on prices or government spending. In fact, some of our so-called economists carry the view that no matter how big the national debt is it does not matter because "we just owe it to ourselves."

### Resolutions

The resolutions passed at the business session pretty well covered the policies and beliefs of the Farm Bureau.

The Farm Bureau favors:

Vigorous support of the United Nations, the strongest kind of defense at home and abroad, maximum production of es-

sential goods and minimum economic controls.

Research and education as the principal help of government to farmers.

Farmer-controlled and farmer-organized groups as the sole spokesmen for agriculture.

The licensing of farm trucks on a more equitable basis.

Funds for the construction of needed buildings at Cornell and Geneva.

The appropriation of adequate funds to finance the 10-year road building program.

Elimination or reduction of PMA payments.

Screening welfare lists and removing unworthy cases.

The Farm Bureau opposes:

Subsidizing food prices by government. Support prices except in time of emergency.

Universal military training.

Legalizing of the sale of oleomargarine which opens the door to fraud.

In his annual report, Executive Secretary Ed Foster pointed out that the Yankee Stadium in New York City would just about hold all the business farmers in New York State. Because they are in a minority, he emphasized the importance of public relations and the damage that can be done by foolish moves. Among such moves he mentioned the price support programs on potatoes and eggs. "Can one blame consumers," he said, "for objecting to such uses of the taxpayers' money?"

### OFFICERS

Warren Hawley, Batavia, was re-named president at the business session; also re-elected were Don Wickam, Hector, vice-president; Marion Johnson, Williamson, treasurer; E. S. Foster, Ithaca, executive secretary; C. Kenneth Bullock, Ithaca, Associate secretary.

Two new directors were elected: Harold Loveless of Skaneateles, and Donald Green of Chazy. Re-elected as directors were: Harold Cowles, Ashville; Marion Johnson, Williamson, and J. Stanley Earl of Unadilla.

Dan Frederick of Altamont was elected president of the 4-H Federation to succeed Wilford Adams of Dexter. Officers re-elected were: Howard Bloomfield of Rochester, vice-president; James McDuff of Schenectady, treasurer; and Rhodell Stanton of Albany, executive secretary. Charles D. Carlson, Sinclairville, Chautauque County, was elected president of the State 4-H Council.

The State 4-H Council and the 4-H Federation agreed on a drive for \$12,000 by April 1 to help support the National and State 4-H Club Federations.

Snapped at the New York State Farm Bureau Meeting, this picture shows from left to right: Don Wickham, vice president of the Federation; Roger Fleming, executive secretary of the American Farm Bureau Federation; Warren Hawley, president of the Federation, and Ed Foster, executive secretary.

## A STORM DOOR only \$1.50

WINTERPROOF YOUR HOME this Easy, Inexpensive Way

**Warp's WINDOW MATERIALS**

**TOUGH - FLEXIBLE - SHATTERPROOF**

MAKE YOUR OWN Storm Door for as little as \$1.50, a storm window for less, with any one of Warp's Window Materials. Stop drafts. Have a warmer, easier-to-heat home. Users report up to 40% fuel savings. Warp's modern, low-cost Window Materials will quickly pay for themselves many times over in fuel saved.

# NEW and GREAT FOR PROFITS 2 Ways!

Hall Brothers

## SILVER HALLCROSS

*Thoroughly Tested and Proven!*

Run your eye through the list of features below. You'll see why our customers are saying "Hall Brothers has really got something with the new Silver Hallcross." Here's a real dual-purpose bird... in every sense of the word. And what's most important Silver Hallcross measures up in every respect to Hall Brothers Quality standards... the standards that mean sure, dependable profits for you.

### FOR EGGS:

- Excellent layers of large brown eggs
- Outstanding shell texture and appearance
- Start laying early
- High persistency
- From well-bred, high egg producing stock on both sides of mating

### FOR MEAT:

- Quick, economical weight gains
- Great for broilers, fryers and roasters
- Well-suited for capons and caponettes
- Superior fleshing... a highly desirable carcass
- Excellent vigor and livability

So, if you want a great producer of either meat or eggs... a bird that makes big money in today's market, investigate Silver Hallcross NOW! See your Hall dealer today or write to us for prices and delivery dates.

We also hatch chicks from 6 Pure-breeds and 7 Hallcross... all top quality chicks.

Send for YOUR copy of our new FREE catalog... it's yours for the asking.

Phone: Walpole 78 • Branch Hatchery, Lancaster, Pa.

## HUBBARD'S NEW HAMPSHIRE

The above picture, taken at the recent session of the New York State Grange, shows from left to right: Past National Grange Master Louis J. Taber of Syracuse, N. Y.; National Master Herschel Newsom; and Dean W. I. Myers of the New York State College of Agriculture.

## Grange Guideposts

Here are a few pertinent paragraphs from the address of National Master Herschel Newsom to the National Grange Session at Atlantic City.

THESE three Grange Guideposts are the basis of our American democratic capitalism—at its best:

1. All prosperity springs from the production of wealth;
2. The compensation of each should be based upon his contribution to the general welfare;
3. The prime purpose of government is to protect its citizens from aggression, both physical and economic.

In thinking of the part the Grange and agriculture must play in conserving and expanding freedom, let us paraphrase the immortal Abraham Lincoln: Now we are engaged in a great Civil War testing whether responsible free men are capable of suppressing personal, local, sectional or National prejudices and self-interest and thus proving themselves capable of governing themselves through a system of government which derives its only power by consent of the governed, or whether the individual shall become subservient to an all powerful state and thus be robbed of individual incentive and have coercion substituted for incentive.

### Facts Bring Understanding

America's greatest need is understanding, cooperation, mutual respect and esteem. Such understanding will result if the facts are known. The Grange and agriculture have been grossly neglectful in the field of public relations. We have heard much about our potency and effectiveness with the Congress. In view of the fact that our efforts there have been rather meager in comparison to many other efforts which have been made, it seems appropriate to ask why we have had even the degree of success with the Congress which we have enjoyed. There is an easy answer. For the most part (and we regret that we cannot say always) agriculture's cause has been stated to the Congress on a basis of justice, equity and in substantial recognition of the national interest.

Several years ago the then Master of the National Grange laid down the challenge that America should learn to "wage peace" with a vigor and devotion similar to that manner in which we had always been willing to wage war, when engaged in war. For the first time in the history of the world, perhaps, this nation of ours is engaged in just such an effort to wage peace.

A year ago the National Grange called for a program of "Pay As We Go" as far as it is economically possible to do so.

Inflation has been characterized as the easiest method of robbing thrifty persons ever conceived. One of the evils of inflation is that it changes the ownership of wealth out of all proportion to the effort or contribution of those concerned. It is therefore grossly dishonest to be indifferent to inflation.

### Political Price Controls

Price controls are almost certain to be administered on the political basis because most people simply want cheap food. Many of them do not honestly understand that an honest price is an essential prerequisite of adequate production.

Like all other Grange programs, its program on taxation is predicated on acceptance of individual responsibility. We must not only accept individual responsibility in the matter of tax liability, but surely we must accept individual and group responsibility to curtail vigorously the cost of government at every possible opportunity.

### PMA Payments Not Justified

It is easy to understand the urban consumer's resentment to paying tax money directly to farmers at a time when the total agricultural income is at present level. PMA payments have been an essential part of the farm program for the past several years. Actually those payments so far as individual farmers are concerned are very small. They have little value to the individual farmer directly. They constitute a negligible portion of any farmer's income, and certainly to the very low income and inefficient farm operator they cannot possibly make any substantial contribution toward providing a decent standard of living.

Certainly there can be little or no economic justification for direct PMA payments to individual farmers at the present time.

### Sound Credit

According to figures at hand, investment of approximately \$9,000 per worker is required in America now. Within agriculture, however, the necessary capital investment per farm worker has reached a new high of \$16,000. It becomes vital, therefore, that we diligently seek a program that will provide credit for agriculture at the lowest possible cost consistent with sound business practice.

The search of truth and the will to try to understand the full meaning of that truth have been the basis of progress throughout the history of the world. There is no substitute for truth and understanding. There is no progress without it.

### KILL Power Failures

Protect your farm and home NOW with this low-cost stand-by generator that operates from tractor belt or gas engine. Complete with water-proof safety switch. Why wait until your lights go out, stoker, refrigerator, water, radio stops—then it's TOO LATE. Write today for full details.

### MORE and Better FOOD

By HERKELL DeGRAFF

TWO important things have been happening with respect to food in this country, and both are tied to production. First, the proportion of choice food in our diet has been increasing. And second, food expenditures have been taking a smaller proportion of consumer incomes.

Two generations ago the food bill of the American wage earning family was slightly more than half of their total income. One generation ago it was down to 40 per cent, and today the food bill of the typical family takes only a third of their income.

With an ever-decreasing proportion of incomes spent for food over these years more has been available for better homes, better clothes, automobiles, radios, and an endless number of gadgets and comforts. These new and exciting additions to our living we have had because labor and skill not needed to provide basic necessities has been diverted to their production.

Production per person in the United States is five times as great as the world average, and ten to twenty times as great as in those countries where production is largely accomplished by hand.

We are, for example, the best housed nation in the world. In American homes there is an average of 1.6 rooms per person. In 1945, 53 per cent of the families in this country owned their homes, 80 per cent had running water, 89 per cent had electricity, and 90 per cent had radios. Two-thirds of all families had private bathrooms. Since 1945 we have built a lot of new homes and have installed bathrooms and other improvements in many existing houses. Just how many we do not know exactly. But a few international comparisons, or even better a little world travel, would quickly convince you that the high average of comforts in today's American housing represents a production miracle.

### Importance of Management

One of the many things that businesses compete for is management talent. There aren't enough superior managers to go around. Between 1920 and 1950, nearly one in ten of all business firms in the country failed each year. New businesses continued to be established so that the total number was not decreased. Many new businesses fail too. And the most common reason for failure, whether of a new firm or an old one, is poor management.

In the 1920's, an average of 40 per cent each year of all the manufacturing businesses in the country reported losses instead of profits (Treasury Department reports). In the 1930's it was 60 per cent—in the worst depression year (1932) 83 per cent of all manufacturers had losses. Even during the wartime boom only three-quarters of the U. S. manufacturers made profits, and the other quarter still balanced their books in red ink.

Whether it is losses or profits—red ink or black—the result depends directly on management. The outstanding business which takes your savings and mine, your labor and mine, produces goods and services we will buy, at a price which meets competition and still earns a profit, is the artistry of the superior manager. His service to society is very great. His numbers are all too few. — Reprinted by permission John T. Graff Co., New York City.

# BABCOCK'S

## HEALTHY CHICK NEWS

December 1951

### How To Get High Winter Egg Production

**Lights:** Artificial lights will help you get high winter lay. If you use morning lights, have them come on at 3:00 a.m. by an automatic time clock. All-night lights will give you good results too, but your litter will usually get dirtier. If you have dimmers, evening lights can be used.

**Mash:** Feed a good commercial laying mash. It will pay. Provide 18 lineal feet of hoppers per 100 layers. Measuring both sides of hopper makes 36' per 100. Keep hoppers half full. Don't waste mash.

**Scratch Grain:** Most any combination of whole or cracked corn, wheat, barley, and oats can be used. Use two or more of these grains that can be purchased economically as possible. Feed 10 to 12 pounds of scratch grain per 100 birds per day. Never feed grain "cafeteria style" unless you have a special "high protein" mash to use with this system. Too much scratch usually cuts production 10% to 20% and increases cannibalism. Feed scratch in the afternoon.

**Pellets:** Pellets stimulate feed consumption and are handier than a wet mash. Feed what they will clean up in 30 minutes at noon.

**Water:** Provide lots of water space for best production. Long water troughs with automatic floats work fine. Ordinary water buckets set on the floor or low stands work well. Troughs low enough so birds can drink standing on the floor are best. If you use the little water cups, put in at least one to every 50 layers. Keep water warm with water warmers or soil heating cable.

If pullets approaching a year of age pause or moult, keep lights on and feed as above. They will come back fast.

Good luck!

*Monroe C. Babcock*

P.S.—Next month—"How to Raise Profitable Pullets in 1952."

### Facts About Babcock's Healthy Chicks

**Size of Business:** We have 22,000 layers here at Babcock Poultry Farm. We think we have one of the best and most practical breeding farms in the U.S.

**S. C. White Leghorns:** Our Leghorns hold the high three-year average ('48, '49 and '50) at egg laying tests for all pens entered over all breeders of all breeds in the U.S. We won the Poultry Tribune trophy in 1949 with the highest average ever made by any breeder. In 1949 we won the California Egg Laying Test with the highest production and greatest profit ever made at that test. We have had high Leghorn pen in the U.S. four times: 1942, 1945, 1947, and 1949. The 1945 pen holds the all-time world record for egg production—both eggs and points—over all breeds.

**R. I. Reds:** We have good Reds. We entered them at Texas, Pennsylvania, and Missouri tests last year. They won the Pennsylvania and Missouri tests—high for all breeds. The Missouri pen was high pen in the U.S., all tests, all breeds. Laid big eggs, too! You will like our Reds.

**Sex-link Cross:** Our Red-Rocks (sex-links) are wonderful layers, beautiful birds. Cockerels make good broilers, roasters, and capons. You will like them, too. Bred primarily to live and lay.

**Satisfaction Guaranteed:** We get a high percentage of repeat business. We guarantee satisfaction to 30 days of age. Guarantee 98% sexing accuracy.

ANIMAL BEHAVIOR  
SHAMES MAN

(Continued from Page 34)

would run you into the side of a barn or tree or do anything to try to kill you. In the pasture the other horses would not let him near them. One morning we found him in a corner beaten to death by the other animals. The other example was a 3-year-old heifer that would not breed. She would go through any fence and refused to do anything right (you farmers know what I mean). She could not stay anywhere near any of the animals. They simply would not let her.

So at least I am convinced that animals have a way of dealing with communists, false leaders, and the one in a million who seems to be of the devil and not of God—even their God.

Animal Security

Our farm animals respond to security just as definitely as we humans. If you forget to feed them even once in a week, and although you give them just as much feed, they will not do as well for you as your neighbor's animals that are never forgotten, will do for him. Let your pastures get short and even though there is feed there, they will not eat much and you can just see them stand around and worry. Now then, if you carry this to extremes they will turn wild, go through fences and become entirely out of hand, producing nothing but trouble. They demand respect, just as we humans, for their rights, privileges and liberties.

Just as definitely they accept their responsibility to their herd, their young, their surroundings and their God. You fail in one of these respects and they will prove to you that you are not a man to handle animals and that you better get into some other occupation—such as selling neckties.

Our animals demand of each other and of us—"Personal responsibility of the individual to his family, his community, his state, his country and his God." They will then produce bountifully for you and for each other, or fight for those rights. Nor will they gang up to exterminate each other. Further, they limit their difficulties to individual differences between each other which always can be settled.

Surely we can do no less.

Express prepaid. Write for my beautiful folder and prices. Jim Shofner, Grower, Tavares, Florida.

Nearly Twelve Years of Cooperation:

During the week of November 9-15, more cows of the five major dairy breeds were artificially bred to NYABC Sires than were bred during the ENTIRE FIRST YEAR of operation.

And—as NYABC enters the heavy breeding season of its twelfth year, first services are averaging 30% ahead of the same period a year ago, despite the fact that the 1950-51 fiscal year was by far the biggest ever, with 212,147 first services in the herds of 36,000 members. Why? —

HARD WORK

Thousands of members, volunteer workers, extension men and employees doing something extra make the AB program grow and prosper.

COOPERATION FROM PROGRESSIVE DAIRYMEN!

The American eagerness to do it better at lower cost has meant acceptance of Artificial Breeding as a modern dairy farm tool. Artificial breeding is being developed by the same spirit that makes all American agricultural and industrial production the envy of the world.

CONSTANT RESEARCH TO IMPROVE SERVICE

Continuing research and analysis makes higher quality semen from better sires available in more places.

ARTIFICIAL BREEDING — A SOUND IDEA

Proven gains in milk production; no danger of handling a bull; "production insurance" through breeding to several sires instead of one.

SUPPORT FROM OTHER ORGANIZATIONS

Organizations who have seen the benefits to our agriculture from artificial breeding have helped NYABC grow through continuous working level education.

Now is the time to join NYABC and enjoy the plus profits of breeding your herd to NYABC sires. In New York and Western Vermont, contact the nearest of 140 local inseminators, your County Agricultural Agent, or write directly to:

# Getting Ready for CHRISTMAS

By DOROTHY WELTY THOMAS

CHRISTMAS! To most of us the very word brings up not only images of brightly lighted stores, the tinkle of bells on street corners, and piles of bills to pay, but also a kind of magic associated with one's own childhood. Closed doors, a mysterious package hidden in the clothes closet, giggles and whispers, and the smell of candy cooking.

I remember the colored paper chains we made at school and later decked the dining room with at home; the big red bell brought out to proclaim the holiday and hung near the spot where we hoped Santa would leave us something. But most of all, the making of candy, gifts, and the sense of festivity we created ourselves out of this and that which was near at hand.

## Prune Babies

One simple thing I remember clearly goes back to a Christmas when cash was scarce and my mother busied herself in the kitchen with a knowing smile. Later she brought out something she called **prune babies** and hung them on our little tree, one for each of us and some to give the neighbor children when they called to say "Merry Christmas." They were made of six prunes stuck together with toothpicks and writing paper circles pasted on the top prune for a face. Mamma drew comic features on these little faces, and for some of the prune babies she made paper hats—little cones set on the funny little heads. They made us laugh and later we could eat them if we wanted to. I believe she used sugar syrup for mucilage. We enjoyed them so much that we made them year after year.

Before Christmas, Mamma would wash and starch all the dolls' clothes (at one time I had 13 by actual count) and curl their hair on a curling iron. Susie, my rag doll, always got a new muslin face. The dolls were lined up on the old green couch resplendent in their clean garments and crisp hairdos to await the coming of good St. Nick.

## Taffy and Fondant

The candy was made long in advance and set to "ripen" in the spare bedroom. It was cold in there (we heated with stoves) and I used to sneak in on the pretense of getting a book or any excuse I could trump up and steal a piece of the sweet stuff. There were twists of taffy, white and brown; walnut shells filled with it, and then gilded on the outside and tied shut with little bits of red ribbon. And fondant, plain and dipped, was tantalizing on the big turkey platter.

Yes, it was what we made at home that made the great day so wonderful and exciting. I soon grew up to make the candy or help my older sister make it, and the decorations were always our stint. My sister and I sometimes made our dining room look like a fireman's ball, but it was fun and we could do as we liked so long as we

didn't set the house on fire with candles.

There are many things today that children can make or help to make that add to the festivity and enable them to give as well as to get. Let them help not only with the home but with community affairs. Small hands can help to gather greens, to wind wreaths, and to arrange a centerpiece for the big table or mantle and tie sprays of evergreen with big red crepe paper bows to deck the church or grange hall.

**Little Paper Christmas Trees** To add color and originality to a table or mantle decoration make a paper Christmas tree for the central theme and add a "drift" of greens to fill the desired space. Bits of color in the form of colored balls, fruit, nuts or other paper ornaments can be added to the greens. To make the paper tree, cut a half circle with a radius of 9" from stiff colored paper. Construction paper size 12"x18" is the best material. Form this into a cone by lapping the ends and pulling the center to a point. Fasten with scotch tape or paste.

Mount this on a "trunk" made of 12 inches of 1/4" doweling thrust into an empty cardboard spool such as cheap Christmas ribbon comes around (pack with soft paper if loose), or use a block of wood 3 inches square and 1 inch thick. The spool can be weighted with gravel and the bottom hole sealed up with paper or tape. Paint the base to match the cone. Use poster paint or any paint you have handy.

Decorate the tree with popcorn before mounting on the base. A four-year-old can do this. Dot the cone with rubber cement, then give the child a small dab of cement on a piece of paper and a bowl of popped corn. Show him how to dip each kernel in the cement so that one side is covered with it and then place it on a sticky spot on the paper cone. Save a big kernel for the very tip top, like a star. Pack the inside of the cone with tissue paper after inserting the

doweling, so that the cone won't swing.

For the "drift," use native greens such as pine, hemlock or balsam. Greens that have been painted white will give a frosty look—or for variety mix with the greens some spirea branches that have been dipped in cooked starch and then in Christmas mica. The "snow branches" echo the white of the popcorn. Nuts can be painted to match the tree and hung on the branches, or nestled in a spray of the greens.

**Stars to Hang Up** Make a pattern of a five-point star. First, cut out "half

back to back. This makes a three dimensional, five-pointed star to hang in a window or on the tree. Make a lot of them, large and small of different colors of paper. If one or two pieces of the paper in a single star are stiff, the third can be thin like envelope lining paper. If you can find some metallic paper, it makes beautiful, glittery stars. Children like to decorate these stars with their crayons—or nail polish. Run a thread through the end of the top point to hang it up by.

**Stable Scene** Set a corrugated pasteboard carton on its side and let it represent a stable. Make some mangers from the flap or lid that you have cut away. Fill these with straw and let the children model animals and figures of Mary, Joseph, the Babe, and wise men on their camels from clay. If you have no modeling clay, let them cut paper dolls and mount them on cardboard or draw them. If you want an elaborate creche, stretch a blue cloth or paint a blue cardboard background for the semi-tropical night sky. Make or leave white flecks for little stars and cut a hole for one big star. Put an electric light bulb behind the scenes to shine through the hole. You could make palm trees of many things—or it would be fun to make a Northeast manger scene and use evergreen instead of palms. Some wonderful creches have been made of snow out in the yard. Use your imagination and let the children make suggestions or do it themselves.

## Simple and Meaningful

It isn't what materials you use nor how perfect the results, but the pleasure that you and the children will get from the doing of it that makes these things a rightful part of the Christmas activities. Above all keep Christmas simple and meaningful, and let each child who is old enough to hold a paint brush or scissors take part in the preparations.

star" drawing on this page, trace around it on an old postcard, and then cut out your pattern carefully, keeping the edges smooth and straight. Next, fold stiff colored paper once, lay the straight edge of your star pattern on this fold and cut out star. Make three of these for each ornament.

Open one of the three stars and paste two folded ones center to center on the open one. I call this a "star sandwich." Then open the folded ones (the free halves) and paste them together,

*How did I ever do without it!*

Procter & Gamble's Exciting, New

# CHEER

Specially made for  
"Tough-Job"  
Washing

**There's never been anything like it!** Procter & Gamble's most exciting wash-day discovery in more than 100 years! New CHEER is *specially made* to do "tough-job" washing better than any kind of soap you've ever used!

**Even dirtiest clothes come sparkling clean!** See how toughest washing jobs come fresher, cleaner in hardest water! When you see how CHEER suds out even greasiest ground-in dirt, you'll see why new CHEER gets *all your wash* so beautifully clean!

**Here's the secret!** New formula makes CHEER *different* from any washing product you've ever used! CHEER is specially made with the *extra power* you need for your *extra-tough* washing jobs!

**Safe for colors, too!** With all its "tough-job" washing power, new CHEER is *safe* for colored washables, *kind* to hands! *Try it next washday!*

**Keep CHEER on hand!**  
**Get the Giant Economy Size package**

**No matter what soap you're using now,  
CHEER guarantees a CLEANER, WHITER wash**

**Double-your-money back** if you don't agree that new CHEER does "tough-job" washing better, gets *all* your clothes **CLEANER**, **WHITER** in hardest water than any brand of soap you can buy. For CHEER's *extra washing power* not only removes grease and graying dirt, but dulling soap film as well. **TRY IT!**

# GOOD CITIZENS or Juvenile Delinquents

## Which Is Your Community Raising?

**N**O NATION can long endure or be morally strong without God," says Mrs. Marie E. Martin of Baltic, Connecticut. "The Ten Commandments and God's word are the only basis for any kind of law and order if we are to live together on this earth in peace and love."

This farm wife, mother of four children four to ten years of age, believes that "next to Communism, the greatest danger to our American way of life is the public indifference to the low moral character of our public officials. I would like to see a return to honor, truth and honesty in our daily lives and, above all, a return to God and a stronger faith in religion."

This return to God, honor, truth and honesty should start with the training our children receive in the home, according to most of the readers we interviewed. The need for strong, active 4-H Clubs, Future Farmer, Future Homemaker, Scout and Grange groups is also apparent in the replies because most of the children of our readers are farm or village boys and girls who, for the most part, have to organize and manage their own leisure hours.

Our farm young people can't walk around the corner to a movie or youth center, and even though most communities and churches sponsor picnics, plays, Christmas and other parties, there are still many, many nights in the year when these young folks want to "do something."

And the parents should see that they can "do something," according to Mrs. Leroy Uhlman of Campton, New Hampshire. She should know, because her eleven children range in age from 19 years down to 16 months, which anyone will have to admit presents a formidable "bringing up" problem. Mrs. Uhlman believes parents often fall down on the job of training their children and teaching them to be good American citizens by failing to see that they are kept occupied.

"A child should have responsibilities of his own to grow up with," she told us, adding that everyone works on the Uhlman 200-acre farm but that there is plenty of recreation, too.

### Keep Up With the Times

Community-wise, the Uhlman youngsters participate in 4-H work, Boy Scout activities sponsored by the local firemen, and high school doings in a neighboring town. Mrs. Uhlman says, "Young people today prefer round and square dancing at a party almost more than anything else, and for this reason church parties often turn into 'flops' when the young people find that older church members frown on dancing. I think even in our churches we must keep up with the changing times."

Although the Uhlman young people have many community activities, and all have work responsibilities, they still have free time and energy, so they're encouraged in individual sports available to most farm youngsters—skiing, skating and swimming. As Mrs. Uhlman says, "They haven't time on their hands to be wanting to go somewhere all the time."

A lady up in Maine, whose family is all grown, says: "In many communities the people and many parents are all too ready to condemn the young people, instead of trying to do something for them; finding fault instead of giving encouragement." Mrs. Arthur Parker of North Bennington, Vermont, agrees with that, saying, "There is

much that's fine in our young people. There is a lack of interested adult leaders to work with, play with, and help guide young people in the right direction. Too few church people will teach a Sunday School class or help with a youth group.

**"So many times our young people are thought of as 'potential delinquents' instead of potential good citizens."**

Needless to say, all of the women who wrote us did not agree on many of the answers to our questions. For instance, though Mrs. Lillian Dianna Carlin of Tivoli, New York, and Mrs. Harry Conover of R. D. 3, Montrose, Pennsylvania, both agree that women should seek public office. Mrs. Carlin says, "If more women were in public office, we would have less graft, cor-

ruption and extravagance in government."

mother doesn't give it, they suffer." Miss Laura B. Downs of Riverhead, Long Island, who says "Delinquent parents are too often the cause of delinquent children," wishes we had more women in government like Margaret Chase Smith, Maine Senator, because she feels such women could put up a better battle against Communism, gambling, drinking, and drug addiction among youth. These, she feels, are the greatest dangers facing America.

Actually only 52% of the women answering our questions feel that women would do any better in government than men. As Mrs. Rufus Nichols of Olyphant, Pennsylvania, said, "I don't think it's been proved that women have helped conditions since having the same privileges as men."

Mrs. Nichols disagrees with most of our respondents on what part the

Smith of Voorheesville, New York, has something else to say. The Smiths have five children, 6, 8, 10, 12 and 13, and Mrs. Smith believes that childless women and those who have already raised their families should assume the responsibilities of carrying on community activities.

### Two Dangers

Mrs. Smith says that communism and juvenile delinquency are two of our greatest dangers, and for that reason a woman should stay at home and concentrate on raising her family. It is her opinion that the woman with a family who neglects them for outside activities is allowing the children too much freedom before they are old enough to understand the responsibilities of freedom.

Mrs. Fred Elcock of Sarver, Pennsylvania, who has eight children, all of them married but one, says, "I don't think any woman is too busy at home to know what is going on around her. I think it is the duty of every woman, childless or not, to join in some community activities."

Supporting Mrs. Smith is Mrs. Helen Miller, a young mother of Glendale, Massachusetts, who says, "I would say the morals of the children would be better if the mother would stay home during the formative years. To do a good job during those important years, a mother cannot devote her time to community affairs." Another woman, at Cuyler, New York, says almost the same thing, "I don't believe many women can do much outside the home and care for the family efficiently, too." She believes that radio and television advertisements for cigarettes and alcoholic drinks are giving young people the idea that to be popular and glamorous a person must dangle a cigarette from his or her lips and guzzle beer, wines, etc. She says, "I think this idea planted in their young minds is ruining more youngsters than anything else."

One New York State woman who prefers that we refer to her as Mrs. A. R. doesn't worry too much about what's "wrong" with America. She says, "Even the hoodlums and the roughies love America and our way of life—all but the communists."

**"Perhaps the thing that is needed is a more serious realization of what we have and perhaps some sort of inspiration. I don't see how anyone can find fault with our youth when they think of our boys in Korea. However, among many of the 'privileged,' there is an attitude of sportiness and 'smartset-ness' that when observed by some of the under-privileged makes them bitter, reckless and ugly—instead of realizing that this is the land of opportunity, and just biting right down on everything, working like fury, and trying to be like the finest people they know."**

To sum up: Most women are keenly interested in public affairs, but they only half believe that women would do a better job in public office than men. And much greater than their interest in civic matters is their interest in their homes and their devotion to their children. As Mrs. Besley of Columbia Crossroads, Pa., says, like a typical mother:

**"Young people are our priceless heritage . . . our only hope for the future."**

### We Asked Our Women Readers. . . .

**W**HAT activities they have time for outside the home . . . . the importance of women taking part in government and community action.

We asked them if parents are falling down in training their children and in teaching them to be good American citizens.

We asked them what they were doing in the homes to help young people develop in the right direction . . . and what was being done in their churches, schools, and communities to interest young people . . . we asked them what they considered the greatest dangers to our American way of life today.

Their answers are on this page.

ruption and extravagance in government," while Mrs. Conover has the opposite to say "because human nature is the same whether man or woman!"

Another Pennsylvania farm wife, Mrs. D. V. Besley of Columbia Crossroads, says that women in government would cut down graft and extravagance. She says, "There's not a woman but what can make the family money go farther than the man could, and the same would be true of public funds. As for honesty . . . visit any jail and note the number of men in it as compared to women. I certainly believe it is important for the future of our country and our children for more women to take a greater part in government and community affairs, for they would be sincere in dealing with all problems because women as a rule are forever planning a better future for their families."

Disagreeing with Mrs. Besley's premise that women are more honest, Mrs. Fred H. Snyder (who has four children under 15 on their busy 160-acre dairy and canning crops farm at Churchville, New York) says, "I think it's fine for women to seek public office, but as far as cutting down graft and corruption is concerned, I guess it wouldn't make much difference, because women in office are subjected to the same pressure brought on the men in office."

Almost all of the ladies agree with Mrs. Thelma D. Ward of Manset, Maine, that women, whether they have a bunch of youngsters to look after or not, should take at least some part in community affairs. Mrs. Herman Facer of Lyons, New York, has three children, ages 8, 11 and 15, and adds to Mrs. Ward's comment, "Every woman needs some constructive outside interest, but it should not interfere with her family. Children take time and if

church should take in providing activities for young people. She says, "The church of my faith doesn't believe in doing anything to attract young people to attend church. We believe that wanting to attend church to worship God should come straight from the heart. In our church children attend with their parents from the time they are babies. We love our minister and enjoy his sermons. We have a good attendance and we don't even have music of any kind."

### Church Activities

On the other hand, many church activities designed to keep young people occupied in constructive ways are listed by these New York State women: Mrs. L. H. Shaver of Canaan; Mrs. John Polle, Lyons; Mrs. Edna K. Elmore, Ithaca; and Mrs. Harold Tripp of Dryden. Among the church activities they enumerated for young people were: Get-together parties, Young People's Clubs, weekday religious education, vacation Bible school, boy and girl scouts, girls' choir, cherub choir, Junior and Senior High Youth Fellowship, midweek family suppers with separate programs for children and Young People's Prayer Group.

Mrs. Conover, whom we quoted above as saying "Human nature is the same, whether man or woman," tells us that they have a young people's director in their church at Montrose, Pa., and the church program includes everything from a Friday Fun Night with games and refreshments and prayer meetings held in convalescence homes to a basketball league and Young People's Prayer Group.

While several women told us that the efficient homemaker is one who can find time for outside activities and that by doing so she is of even greater help to her family, Mrs. John F.

# Beech-Nut

## *Famous for Fine Flavor*

### Strained and Junior Foods

Widely recommended by doctors, pediatricians and food specialists for their flavor and fine food value. The flavor appeals to babies.

### Cereals for Babies

Nutritious! Delicious! No cooking needed. Ready to serve with addition of milk or formula.

### Coffee

Pound after pound Beech-Nut Coffee gives the same rich satisfaction. It's sample-roasted and flavor-tested.

### Peanut Butter

Two kinds of Beech-Nut Peanut Butter — with fine flavor. Regular and new "Easy to Spread"—smooth and super-creamy to bottom of jar.

BEECH-NUT PACKING COMPANY • CANAJOHARIE, N. Y.

## You Can't Grow In a Straight Jacket

This corporation has been continuously in operation for sixty-nine years because during most of that time it has been allowed to mind its own business. Our founders used their own judgment and made their own decisions. Government provided only a broad opportunity for all free enterprise to function. Profits became building blocks of the future. Natural laws provided ample controls.

This business can continue for another sixty-nine years only if the original freedoms of this nation are restored to it. No business, individual or corporate, can succeed if a whimsical, arbitrary authority is permitted to bind it with experimental controls, directives, regulations, excessive taxation and drastic limitations.

## We Are Neighbors By Florence Potter

IF EVERY American woman realized how the women in other lands look to her for leadership, she would speak and act differently in many situations. I shall never forget the feeling of responsibility I had last year when the leader of our group of 150 American women, delegates to the 6th Triennial Conference of the Associated Country Women of the World, held in Copenhagen, Denmark, said to us just before we left our ship at Southampton, England:

Mrs. Florence Potter

"You are ambassadors of goodwill, and many people will never know America except in the way you show it to them."

In Copenhagen we met women from eighteen other countries — from Canada, Iceland, India, New Zealand, Australia, the Hawaiian Islands, South Africa; from all the countries of Europe that are not controlled by Russia; from Ireland, Wales, Scotland and England, and we learned that love of home and family and the desire for peace are the basic urges of women everywhere.

### Tolerance Not Enough

We returned home with a greater appreciation of one another and a realization that tolerance of "foreigners" is not enough; that there must also be understanding and appreciation of their culture and customs. We learned that in many countries, travel is almost impossible, so the homemakers have worked hard to bring all the beauty they can make or buy into their homes. Many paintings, tapestries, and pieces of lovely handiwork have come down to them through

generations and are loved and cherished.

When we heard the problems of the Norwegian farm women, we felt that American women had everything. But when we heard of the group loyalty of the Swiss women, we weren't so sure. In that mountainous country, modern conveniences are few, but the women work together to do the heavier tasks, such as the spring and fall washings. One Swiss woman was fortunate enough to be able to have an electric washer, but was not sure she would keep it, as her neighbors were feeling unhappy about it—not because she had more than they, but because they would no longer have work to do for her and she would not be sharing their work with them!

### It Will Surely Help

Any intelligent woman can learn more about our neighbors in other lands, even if she never visits them. Such knowledge should lead to better interpretation of headlines and radio broadcasts, and then to discussions with the family. Our children in school and on playgrounds are meeting and working and playing with many children whose parents came from a foreign country. If all these youngsters learn to understand and appreciate one another's background, it will surely help the coming generation to work with other countries in a much more effective way than our generation seems to be able to do.

To make our own democracy survive will require an active participation on the part of every citizen, man, woman, and child. If we are to keep an even keel in these frightening days, there must be straight thinking and positive action by all of us, and this includes an effort to understand and appreciate our neighbors in other lands and to work with them for a peaceful world.

## What I Want for My Children

By MARGARET C. AIKENS, North Clymer, New York

I GUESS I'm your "average American." I'm a woman a little past thirty with two children and a husband.

I would like my children to grow up to be good citizens of the world. First of all, I want them to be religious. I hope they will acknowledge that God is the Supreme Ruler of the world. I hope they will learn to give to others, to help their neighbors, and to follow the wonderful example of Jesus in all things.

My children do not go to school yet, and it's hard to take them to Sunday School. Their daddy is away most of the day, so it's up to me to teach them. I have a book of Bible stories that I read to them all too seldom, but I will try to get more books for them about Jesus and sing them more hymns. It would help me if there were a "Church for Children" radio program that I could tune in about 9 o'clock on Sunday morning. This should be non-denominational and could be made up mostly of hymns sung by children, with a dramatized Bible story and a true life story of good deeds practiced today.

Next I want my children to learn about and appreciate the wonderful heritage they have as Americans. I sing patriotic songs to them, such as "God Bless America," but children learn so much more easily from pictures that I wish some book company would publish a few simple picture books based on patriotic songs for small children to look at while mothers sing the songs.

We mothers should start a crusade to clean the murder programs off television and radio. I've read that a child sees violent death forty times a week on television. Instead we could have movies showing the scenic wonders of our land, and historical dramas and travel pictures. Children could learn much that is good from television.

When my children are grown up, I want them to work for good government, for the freedom and uplifting of all peoples throughout the world. In order to do this, I will vote and take my own small part in the making of good government, and I will try to interest other women in doing the same.

### Family Fun

I want my children to learn to play with other children, to have fun without being destructive, so I plan to ask neighbor children to come here for parties of various kinds. I want my children to get in the habit of entertaining at home. I want them to play group games and learn to be good sports and to play fair.

I want to keep my children at home or at least in the wholesome atmosphere of farm life, so I'm going to try to make life on the farm as entertaining as possible. Their father comes into this plan in a big way, too. He wants to construct a pond. He is eagerly awaiting the day when his son can go fishing with him, and he talks about taking him coon hunting. When the time comes, I'll try to take over a few chores occasionally so the two of them can be pals together.

# Casual Classics

No. 2736. Three classic blouse styles come in one pattern with sleeve choice. (Drawstring neck style not illustrated.) Sizes 6-16. Size 12, with convertible collar or pleated front, 1½ yds. 35-in.

## Eight Opinions

**Women Readers Set Forth Their Ideas on Raising  
"Better Young Americans"**

### TRAIN UP A CHILD

By MRS. MELVA S. ROBINSON  
Interlaken, New York

AS THE mother of two young children, I'm extremely interested in laying a good foundation of living for them. I think mothers can best help their children to become good citizens by first being good citizens themselves. My upper-most thought is: "Am I being a Christian example to my children?"

Too many mothers are working full time outside the home, leaving their children in the care of others, and thus the children lose out in the teaching of necessary principles of happy and useful living. Only as a child is taught to work and assume responsibility will he be equipped for good citizenship in adult years.

My chief source of strength in meeting day-to-day problems is the only true source, and that is God. I would not attempt to guide my children without dependence on Him and the Holy Bible.

"Train up a child in the way he should go and when he is old he will not depart from it."

### THEY NEED OUR LOVE

By MRS. VERNON BUSSINO  
Montpelier, Vermont

IF OUR children are to become the right kind of American citizens, we must teach them the ways of Christianity, and, above all, we must love them. They need our love and faith for security. Feeling secure in the home will enable them to face life squarely and fairly.

We need to teach them to live by their own efforts and work, too. My two youngsters are only 5 and 7½, but they can help on the farm. They do not ask for pay, for they know they are part of the family work line, though when we ask them to do extra things, they get a reward.

There is a lot to do on a farm, but I find there is time for fun, too, with our kiddies, and that God is good to us. When things go wrong, I try to remember how really lucky we are, and I think of others who are hungry, suffering, and denied their God by threats.

### A WORKING FAITH

By MRS. K. W.  
Vermont

I DO NOT believe any mother or father can be a good American citizen unless they have a sincere, working faith in God. It must be a faith which they not only take to church on Sunday, but also take with them on the other days of the week.

The sooner this country comes to its senses and climbs out of the slough of dissipation, dishonesty and greed, the sooner will we start back on the road to a sound, stable economy and life. Our country was founded on Christian principles and by Christian folk, and if we don't return to those principles and put Christian people back in office, we will go the way of many another nation.

### CHILDREN NEED HEROES

By MRS. M. B.  
New York

MOTHERS should always remember that children are great imitators. In training children, what you do speaks louder than what you say. Children build their ideals day by day by watching the behavior of the people they live with, and they need heroes of the right sort to imitate. The best hero a child can have is his own

father, and the wise mother makes good use of this fact.

She might also tell the child true stories about his own ancestors. It gives him something to live up to, a tradition or high ideals to carry on.

The mother's time to shape her child's character is definitely in his pre-school years. When he goes to school, he comes in contact with conduct and morals over which the parent has little control. But during the pre-school years, the mother may help him to establish for himself a definite pattern of right thinking and doing which will serve him as an inner guide all his life.

### A BETTER JOB

By MRS. E. H. WYMAN  
East Swanzey, N. H.

WE MOTHERS should wake up to our responsibilities. It's our duty to teach our children respect for other's property and rights. We are all too ready to sit back and let the teachers and organizations do our jobs.

Too often we fail to be good examples for our children. If we are dishonest and untruthful to them and others, how can they be honest and honorable? If we find it easier to stay in bed Sunday morning than to go to church, how can they be expected to become church-goers?

### PLENTY TO DO

By MISS VITA BATES  
Walton, New York

MY CHIEF interest centers in my church and our local Council of Churches, which has charge of week-day religious instruction in the grade schools. When teachers are secured, the high school also will have such courses. Recreation for the children of our town includes a fine swimming pool, with supervision, during the summer months.

Our churches do good work with their young people on both Sundays and weekdays. Our WCTU sponsors a Loyal Temperance Legion and a Daily Vacation Bible School is a regular summer project.

### IT ALL DEPENDS ON US

By MRS. CHARLES LEE  
Boonville, New York

WE HAVE tried to bring up our children to be good citizens. They all vote because they know it's their civic duty. They all work hard for their living. We all belong to the church, believe in it and support it. We are all interested in community affairs. Naturally, we have our faults (but who doesn't?).

Juvenile delinquency got its foothold during World War II. I think it was wonderful for some women to work—they did a tremendous job and America is proud of them. But when young mothers left their babies to grow up with others to look after them, it was a grave mistake.

Life is what we make it and if we expect good things from it, then we must put a lot of good into it. As mothers, let's love and understand our children better, so they will do better by us and by our country later on.

### WHAT CHILDREN NEED

By MRS. R. I. W.  
New Jersey

I THINK our children need these things to become good citizens:

A Christian home and a good example; an open church door, Sunday School and vacation Bible school; good schools; clean friends and associates; membership in fine organizations, like 4-H Clubs and Girl and Boy Scouts.

## New York Home Bureau Women Plan Broad Program

By MABEL HEBEL

**S**PEAKING to Home Bureau women attending the 32nd annual meeting of the State Federation of Home Bureaus in Syracuse, Miss Frances Scudder, State Leader of Home Demonstration Agents, declared that the N. Y. Home Bureau citizenship training program has won national recognition. Thirty-five thousand of the Federation's 103,000 members are now taking part in it.

Again and again at the two-day meeting, the importance of the home as a source of national strength and the political responsibilities of women were stressed. Miss Hazel Reed, assistant State Leader and one of a panel of four women who reported on a recent conference on womanpower in the "Defense Decade," pointed out that women make up 52 per cent of the population, but hold less than 1 per cent of appointive and elective offices.

"Women do not fail as homemakers," she said, "but we often do as citizens. Our inattention to public affairs is dangerous. In normal times, it permits graft. In abnormal times, it can mean disaster. Democracy is a process as well as a goal, and we each have a part in it."

### Individual's Responsibility For Health

Other members of the panel were Dean Lee Vincent of the State College of Home Economics; Mrs. Homer Day of Oxford, and Miss Martha Pratt, Oneonta State Teachers College. Each reported on a different aspect of the womanpower conference. Mrs. Day, who discussed the "Health and Welfare" section, said that the conclusion reached was that there is a clear distinction between medical care and health; and that while medical care must be left to the doctors, health is a matter of individual and community responsibility and training.

Mrs. Ralph Reid, Salem, N. Y., retiring president of the Federation, urged that every Home Bureau unit plan some community project for the coming year. She spoke of the ever broadening program of the Home Bureau, and both the county reports and those of State Committees gave proof of its scope. County reports were almost equally divided between home-making projects and community activities.

During the past year, Home Bureau members' pennies have raised a \$700 "Pennies For Friendship" fund, and their dimes have added \$8,000 to the Federation's Scholarship Fund, which now totals \$61,000. In connection with the 1951 scholarship fund, it was announced that it was to be named in honor of Mrs. Henry Wagenblass, Warsaw, N. Y., a Past President of the organization.

Mrs. Wagenblass presented the report of the Resolutions Committee. Included among 14 resolutions receiving unanimous approval were support of the Mid-Century Youth Conference Program; a statewide health and safety campaign; and cooperation with local and state civil defense organizations. The Federation also called on schools to emphasize the teaching of American history; to open each school day with a non-denominational service; and to instruct children in what narcotics do to their victims.

### Cited For Leadership

Eight Past Presidents of the Federation were present at the meeting and were cited for their leadership. Each was presented with a gold pin inscribed with her name and dates of term of office. Those present were: Mrs. Eliza Keates Young, Milton; Miss Elizabeth MacDonald, Delhi; Mrs. Martha Eddy, Ithaca; Mrs. Evalyn Gatchell, North Rose; Mrs. Wagenblass; Mrs. Florence Potter, Truxton; Mrs. Wentworth Fay, Malone, and Mrs. Lynn Perkins, Lake Luzerne. Another former Home Bureau leader who was especially honored was Mrs. Ruby Green Smith, Ithaca, N. Y.

In addition to the elected officers pictured above, Mrs. Carl E. Ladd, Ithaca, was re-elected Secretary; Mrs. Charles Stanley, Glens Falls, was elected director for the Eastern District, and Mrs. Reid, the retiring president, was elected Honorary President.

Besides the interest packed session, there was a topnotch entertainment program and many intriguing home-making exhibits by different counties. Also, the State Library had a fine exhibit of good books for adults and children. A list of these books may be had by writing to Mabel Hebel, Home Editor, AMERICAN AGRICULTURIST, Box 367, Ithaca, N. Y.

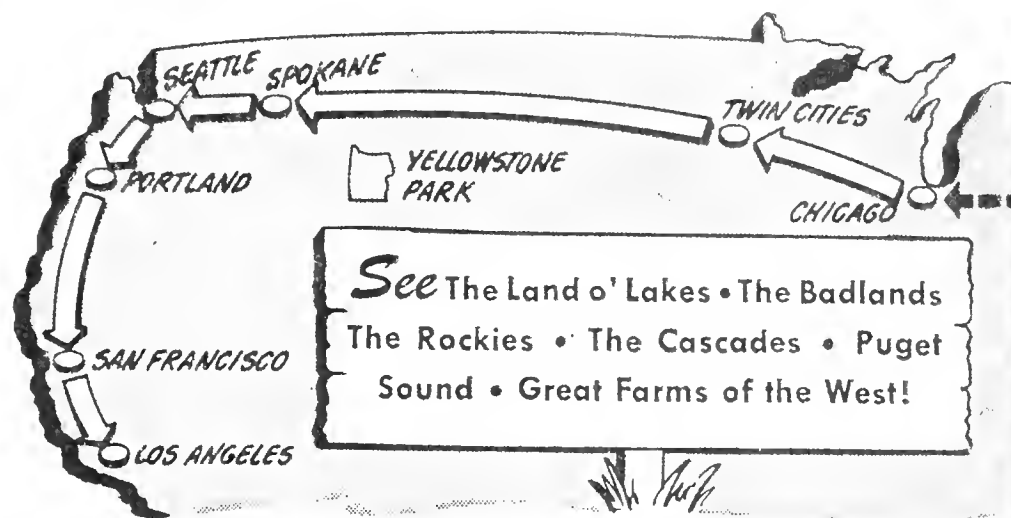

## GOING TO CALIFORNIA THIS WINTER?

Verne BeDell, Northern Pacific travel counselor—well known to thousands of Agriculturist readers—can help you...

For the vacation trip of a lifetime...

## GO NORTH COAST LIMITED

In California you'll bask on sunny beaches, enjoy great cities like Los Angeles, San Francisco, and San Diego. You'll visit old Missions, see Hollywood movie stars in person!

On the way you'll marvel at magnificent scenery as it rolls right by your window—vast western prairie farms, the snow-capped Rockies, the thick, green forests of the great Pacific Northwest.

You'll travel in real luxury on NP's finest train—the streamlined North Coast Limited. Verne BeDell will answer all your questions, make sure that you get the best of service and accommodations. Whenever you are thinking of a western trip, please write us for dependable information. Our travel service is yours for the asking.

# See Here, Mr. Eastman!

**E**VER since Editor Ed Eastman wrote his editorials, **A CHALLENGE TO WOMEN** (August 18 issue) and **HAS WOMAN SUFFRAGE FAILED?** (September 1 issue), he has been dodging verbal brickbats from the ladies, but he says it has been worth it, because his editorials did what he hoped they would — that is, make more women think about their political responsibilities.

In his editorials, he said that the results of woman suffrage have not only been disappointing, but that since it started, America has been at war, taxes have risen ruinously, and our government is riddled with scandals. He added that he would like to see women as interested and efficient in their "public housekeeping" as in their private housekeeping.

After the first editorial was printed, comparatively few letters were received from the ladies. They were evidently too stunned to reply, though one Pennsylvania woman sent in this caustic comment: "Well, so we're to blame for the wars, taxes, and government corruption! What won't the men think of to blame on us next!" But after the second editorial came out, letters poured in. We are printing all we have space for on this page.

Many of the writers suggested to the editor that he get down to brass tacks and tell women in half a dozen easy lessons how to take an intelligent part in government and politics. The immediate result was a new department in **AMERICAN AGRICULTURIST**, **"WHAT CAN I DO?"**, written by Editor Eastman personally. And it's not just for the ladies! It's for the men, too. We can all use the practical, definite suggestions in it.

## MEN, TOO

**I**F your articles had been written about the indifference of both men and women to casting their vote, I could have agreed that all too few citizens of both sexes take this great privilege seriously enough. But why make women bear the brunt of the failure of government to make a peaceful, prosperous world?

Your articles are defeatist and destructive, and you owe those of us (and there are many) who take these things seriously an apology. With your widespread circulation you could be a great force for good. You could inspire thousands of women to keep on trying to learn in a short time what it has taken men so many years to learn about government. You could even suggest that they join their nearest League of Women Voters. — *Mrs. H. P. Stewart, Binghamton, RD 3, New York.*

EDITOR'S NOTE: Mrs. Stewart's letter bore fruit in our Oct. 20 issue, pages 3 and 15.

## HAD TO CHOOSE

**I** too, favored woman suffrage, but not because I thought the government would be greatly improved. It was only fair and just that women should have the right to vote for the laws under which they must live. Taxation without representation is always wrong!

I know that many American men deify the American woman, but while I respect and like my own sex and have many women friends, I have never thought that the average woman was any better than the average man, or that the mother's influence on the children was any greater than that of the father. Having reared a large family, I know whereof I speak.

I have always wanted to serve on a jury and to take an active part in government, but have been too busy car-

ing for our big family. Should I have neglected my family—or was I serving my community better by trying to bring up my children to be moral, upright citizens?—*Mrs. —, N. H.*

## SOMETHING WRONG

**I** GO around among 26 different families as DHIA Supervisor. You assume in your editorial that all women do a good job of "private housekeeping." They don't by any means—and where you see an unkempt house, you are apt to see a slovenly barn too. By-and-large, husbands and wives are alike in their habits and interests.

However, I do believe that something is woefully wrong with our educational system when citizens (regardless of sex) aren't inspired to have a feeling of responsibility toward public affairs. It is true that most rural people have an intense interest in their own community (town meeting, school affairs, etc.) but for almost every ruralite, that is where they stop. —*Miss C. M., Vermont.*

## "DARNED-FOOL EDITORIAL"

**T**HE chief reason you have not received more letters from women in answer to your darned-fool editorial is this: Most of us are too busy being wives and mothers to take the time to explain why we have not been able in thirty years, more or less, to clean up the mess you men have been over nineteen hundred years in the making.

Right now I am busy canning, which is more important to me, as well as a more important contribution to the national economy, than letter-writing. —*Mrs. Kurt Schindler, South Berwick, RFD 1, Maine.*

## "THE WOMAN WAS TO BLAME"

**H**ERE is an item for you men to think over. In line with your editorials, a woman urged that our Grange take action against gov-

ernment controls. Some of the men were on the fence about it (right here in a farming community at that!) but the Grange took action and sent telegrams opposing controls and urging greater government economy.

On other matters involving items just as pertinent and advocated by you and our Grange officers, several influential men have voiced the notion that "it doesn't pay to write letters or send telegrams. We elect our representatives and they are responsible for the decisions made. They never read our letters, anyhow. Let's lay it on the table."

I haven't heard a woman say anything like that!

In another editorial you spoke of the great need for spiritual progress. I am with you one hundred per cent—but why don't you ask why more men do not go to church? It is a manly thing to do. It shows we all prize deeply our right to freedom of worship. It shows we are willing to forego ball games, golf, hunting, pleasure rides, and washing the family car to stand up and live our faith in God and His righteousness, and to express our thankfulness for His unnumbered blessings. There is no substitute for God. The reason why things are in such a mess is that we put personal pleasure first. —*Elizabeth Arthur, 344 North State Street, Lowell, New York.*

## GIVE US TIME

**Y**OUR editorials, "A Challenge to Women" and "Has Woman Suffrage Failed?" have been called to my attention and I am writing to tell you how grossly unfair I think you are. When you expect women to correct in thirty years what it has taken men one hundred seventy-five years to ruin, you either think women are potential workers of miracles or you lack good plain common sense.

Many women, as well as many men, should take more interest in town and country district governments and in

local, state, and national affairs; and there is much room for improvement in the attitude of those who are now concerned with them. I would point out to you, however, that it takes time to accomplish these things in a democracy—and heaven forbid that we desire anything but that! — *Frances M. Wright, (Pres. League of Women Voters) 9 Minden Ave., Binghamton, New York.*

## GOT RESULTS

**I** JUST can't let Editor Eastman's challenge to women go unanswered. Thanks to him for getting us women stirred up! Perhaps he could have a political column on purpose for women. I think more of us don't vote because we don't know what it's all about. We don't go to the barber shop or any place where politics are discussed much.

I always like the explanations the **AMERICAN AGRICULTURIST** gives us of state amendments to be voted on.

—*Mrs. Norman Aiken, North Clymer, New York.*

## MUST PULL TOGETHER

**I** DON'T know whether us womenfolk ought to laugh or cry over your lament on woman suffrage. Until woman suffrage became a reality, men had everything their way. Women were mere property, children another commodity—and sad to say, in most of the world they still are. Here in this land, based on Bible believing, liberty and responsibility, we have the beginnings of a better way of life. The challenge is immense. Is it too big for us? Or will we go on with faith in God's promises?

Woman suffrage hasn't failed. Men just think that it has because they are trying to shift their responsibility. We must all pull together in life's yoke—the burden can at least be shared. Woman suffrage alone won't automatically cure our social ills, but with men and women working together the potential is unlimited.

—*Mrs. Harold L. Donner, 373 West Third Street, Elmira, New York.*

## HOPES TOO HIGH

**I** AGREE with you that the results of woman suffrage have been disappointing, but I also think that hopes in its results were too high. It was right that women should have qualified equally with men. Also it should be remembered that wars were fought and governments set up by men before women had any say about them.

Intelligent women are interested in promoting international peace and in helping women in other areas gain educational and political freedom. And they do help to influence legislation in their local, state and national governments. —*Miss Elizabeth A. Woodman, Newtown, Pennsylvania.*

## DUMB AND INDIFFERENT

**M**OST women didn't ask for the vote, so didn't have any big ideas about reforming politics. However, large numbers have done their best with the privilege.

Then, as you know, plenty of women are as dumb and indifferent as men. They don't know what it is all about and don't want to learn. You couldn't get them to civic betterment meetings nor to a lecture on good government. A lot of them have been told so long and so convincingly that they don't know enough to mix in politics that they believe it.

Even when we do as much as we can toward better government, it seems to do no good. The powers-that-be go right ahead and do as they intended to do in the first place. If we could get women into half of Congress, state legislatures and the Cabinet, maybe there would be some changes made. —*Mrs. Winifred E. Rich, Canadadea, New York.*

# Patriot's Pledge

**I** BELIEVE that my personal liberty is in danger.

I believe that the time has come for a personal rededication to unselfish citizenship.

I believe that as citizens we are being bought and seduced by federal government funds and favors.

I believe the politicians who promise the people doles for votes are false prophets and enemies of freedom.

\* \* \*

**I** BELIEVE that those who corrupt self-reliance with government gifts are our most dangerous friends.

I believe that opportunity is more important than security.

I believe that the "welfare state" will lead us into socialism, and maybe communism.

I believe that the nation's first line of defense is a sound, solvent economy at home.

This pledge is taken from W. W. Ward's column in the "Beaumont (Texas) Journal" of July 4, 1950, where it appeared with the following introduction: "Hubert Harrison, of the East Texas Chamber of Commerce has drawn up a Patriot's Pledge for use in 'East Texas Magazine' and mailed out a number of copies to his friends. It seems to hit the spot in many places."

# NO DRUMS

OFF THE PRESS DECEMBER FIRST

..... just in time

For  
Christmas  
Giving

E. R. Eastman's

*Newest and Greatest Book*

The Complete Novel—Not the Condensed  
Version You May Have Read As a Serial.

**H**ERE IS a story right from the heart ..... and from much of the life of the man who brought you *Horse and Buggy Days*, *The Trouble Maker*, *Tough Sod*, *These Changing Times*, *The Destroyers*, and *The Settlers*.

**NO DRUMS** is one of the most revealing stories ever written about life at home during the Civil War period. There are battle scenes to excite the most adventurous, but much of the story is based upon the writer's own family experience.

Ed Eastman's Dad was a Civil War veteran and Ed has woven into this exciting fiction many of the true tales of adventure his father told him, though the real plot is built around the sacrifices and deeds of the women of the family during the war.

You'll hate some of the characters, and others you'll love. They are all so real and, whether hateful or lovable, are strong, rugged individualists fighting in their own way for their loved ones, their lands, and their beliefs.

**NO DRUMS** is an ideal Christmas gift that will be shared and enjoyed by the whole family. Clip the coupon below and send it in today.

Use This Coupon to Order Either or Both of Ed Eastman's Books

AMERICAN AGRICULTURIST,  
Box 367—ND  
Ithaca, New York.

(Please print carefully to insure prompt delivery.)

Mr. Eastman will autograph copies on request.

## 500 COPIES Still Available

One printing of E. R. Eastman's *The Settlers* wasn't enough to satisfy the demand last Christmas, so we made a double printing and still have a few copies left—510 to be exact.

We know that many of you who read *The Settlers* and were unable to buy the extra copies you wanted as gifts last year will be glad to know you can get them now, if you hurry. Orders for *The Settlers* for Christmas-giving will be filled in the order received.

*The Settlers* is an absorbing love story as well as the story of hardships and sacrifices of primitive living on the new farm, of death on the trail, and of some of the inglorious battles of the War of 1812.

The critics call it a "valuable contribution" and "an important addition to the epic of America."

IF YOU MISSED "THE SETTLERS," ORDER IT NOW  
BY ITSELF OR WITH YOUR COPY OF "NO DRUMS."

# A Bayard of Chivalry

By GEORGE DUFF

(Reprinted from an old issue of the Dairymen's League News, courtesy of George C. Lee, Editor.)

**T**HE row of stunted maples beside the hill road swayed gently in the breeze. The sunlight of a May morning beat through their infant foliage to lay a flecked and speckled glory on the ribbon of highway that wound down the slope. A red squirrel chattered on the stone wall, a robin trilled in a wild apple tree, and the Tin Peddler, perched high on his cart, felt constrained to add a note of his own to the melody of the morn. He knocked the ashes out of his old clay pipe, leaned back to shove the brake-level up another notch, and his cracked but not unmusical voice arose in expression of a Ballad of Lake Huron:

"Her brown hands toy with the flowers in her lap,  
Spicy juniper, balsam sweet,  
Her dark hair waves from her red-beaded cap  
Down to her little moccasined feet:  
Behind us the north wind sings in our wake,  
Wing-and-wing he bears us away,  
And off to the right o'er the sparkling lake  
Looms the dark headland of Thunder Bay."

The cart rattled down the last pitch of the hill, crossed a bridge over the ravine, and swung up in front of a weatherbeaten farmhouse on whose porch sat an equally weatherbeaten woman industriously peeling potatoes. She raised her eyes and her voice simultaneously.

"You needn't stop here, mister," said she. "I don't want anything today!"

Now in making this statement the lady of the farmhouse erred considerably, because she was in actual want of almost everything that makes life endurable. She wanted, for instance, music and laughter and warm affection and pretty clothes and a chance to go somewhere once in a while and show them. She wanted a break in the endless monotony and the soul-killing weariness of unremunerative toil. She wanted nice furniture and attractive rooms to put it in, and a tree-bordered yard beside a road where folks went by every day; and most of all, a chance to meet and visit and work and play with her own kind and widen her poor, hopeless, toil-narrowed perspective of existence.

"No, ma'am," said the peddler cheerfully, as he wound the reins around the brake-lever and climbed over the wheel. "Thought maybe you might not want anything, but I just allowed to stop and let the team breathe a minute. They're light, and when I'm loaded pretty well

it crowds 'em like everything on a hill like that. Didn't know, too, but that you might have a few rags or rubbers to sell. I could give ye either cash or trade, an' the highest prices."

"I haven't anything," replied the lady. "I had a bag of rags saved up, but my husband took them to town the other day and traded 'em for a new milk pail."

"Pshaw, now," said the peddler, "that's too bad, 'cause I'd liked to have got 'em. I suppose he had to have a pail, though, and didn't know I'd be driving around this way."

"Yes, he had to have a pail," agreed

the insurance. I don't know anything about it, but it seems funny that the stock was all out to pasture so early in the season. One of the neighbors claims, too, that he could smell kerosene plain as skunk's oil when he first got to the fire. Are you any acquainted with Jeff Rounselle's folks?"

"I've heard of 'em. Live over in Orton Valley, don't they?"

"Yes, and I heard this morning that Jeff's oldest girl run away with a sewing machine agent last Thursday. Can't git no trace of 'em anywhere. I ain't got much use for sewing machine and lightnin' rod agents. Pretty bad lot, takin' 'em as they go."

"What about tin peddlers?" questioned the lady with dry humor.

"Well," admitted the peddler, sheepishly, "some of 'em are a little tricky, but they run pretty fair. Anyway, most of 'em is like me, so old and humbly that there ain't no heartbreakin' over 'em. Come down to the cart, ma'am, and I'll show you the prettiest nickel-plated teapot you ever set eyes on. I'm takin' it around on an order from Deacon Hynes' wife."

"Twon't do any good for me to look

shining teapot. At last she spoke, softly, and half to herself. "I wish I had the money to buy that," said she.

"This one is sold, ma'am," said the peddler. "I could get you another pretty quick though, or I suppose I could let you have it and order another for Mis' Bynes. Probably I could get it to her within a week."

"How much do they cost?"

"Two dollars apiece, ma'am. If you bought one in a hardware store they'd ask at least twice as much for it. If you ain't got all of the money now, you can pay a little and I'll trust you for the rest till I'm along next time."

"Tain't no use," said the woman. "I wouldn't get hold of two dollars in a lifetime. No use in my thinking about buying anything pretty." She turned sadly away towards the porch, and halted, seized with an inspiration:

"I've got an old wash boiler with a solid copper bottom," said she. "I don't suppose there'd be enough copper in it to pay for the teapot, would there?"

The tin peddler, leaning against the rear door of his cart, shifted awkwardly from one foot to the other. His gaze wandered over the landscape, dreary even under a May sun. It drifted from the unlovely front yard to the visible part of a more unlovely back yard; took in the paper-curtained, blindless windows and the unpainted porch, and at last came back to the figure of the woman in her faded calico gown, standing with toil worn fingers intertwined in hopeful and yet fearful eagerness.

"Why, yes, ma'am," he said, "if your boiler's got a good copper bottom, it'll just about pay for one of them there teapots. Fetch 'er out, an' let's take a look at it."

With flying feet the lady departed to the rear of the house, returning in a moment with a battered clothes-boiler. The peddler took it, pretended to examine it carefully, and then jamming it securely behind the seat on top of his cart, he brought forth again and handed to the woman the shining new teapot. Swinging himself then to his lofty perch he gathered up the reins, clucked to the horses, and with a smile and a bow drove off down the road leaving the lady standing in almost stupefied amazement at her good fortune. Just beyond the turn of the highway the peddler twisted about to smite the old copper boiler a resounding whack with his fist.

"Dodblast ye," said he, "you ain't worth twenty-five cents, and I've gone and played the danged fool again! Maybe though, that deal will sort o' even things with the Recordin' Angel for my beatin' Hades out of old man Billings in that hoss-trade yesterday!"

He spat gustily over the near wheel, chirruped to the team, and once more his voice arose in quavering melody:

"Two lovers behind and two sails before,  
Wing-and-wing went drifting away;  
First a sail, then a speck, then nothing more  
Save the blue water off Thunder Bay."

## The Song of the Lazy Farmer

that I am simply much too wise to use my time at pitching hay or working in some other way; it's shameful that such talent goes to waste beneath her very nose.

**S**OME men are born executives; and just as long as each one lives, his leadership comes naturally and folks treat him respectfully. But others do not like to lead, and folks like that we also need; they are the followers who do the work that bosses tell them to. Now it just happens that I'm one of those men born to help things run by giving orders to the drones who work with muscles and with bones. For I was born to use my brain and not to toil or sweat or strain, so ev'rybody should treat me with all respect that's due, by gee.

Mirandy, though, don't understand, that in this great and mighty land, true leadership is mighty rare and should be treated with great care. She does not seem to understand that I can best lend her a hand by using brain instead of brawn. She treats me like I'm just a pawn that she's supposed to boss and scold while I do just what I am told. I wish she'd come to realize

the woman with some bitterness. "When I have to have anything, I can just take it out in havin' to have."

"Well, now, that's the way it happens sometimes," observed the peddler, "but when a man's driven with work and hard luck, like a farmer is pretty often, he ain't always just accountable. Lots of times he means better'n he acts. Hear about Jim Liscomb's barn, up on Howland hill, burnin' night before last?"

"No," answered the woman, "we don't ever hear any news here."

"Yes, burnt to the ground, clean as a whistle. Considerable of a mystery how the fire started, an' there is them that says old Jim set it himself to get

at it," stated the farm lady. "I ain't got any money to buy teapots with."

"Come and look at it, anyway," urged the peddler. "It ain't for sale, but maybe you'll see some other little trinket that you'd care to buy."

"I can't buy anything," the woman said, as she arose and set the potato dish on the porch floor, "but I'll look at your stuff a minute. Oh, my! I never saw a teapot like that before! Looks just like silver, don't it?"

"Yes, ma'am, and it'll wear for years and years without tarnishing. It's solid, seamless copper, an' triple-plated with clear nickel."

The lady of the farmstead gazed long and with glistening eyes at the

## Economical Cough Relief! Try This Home Mixture

No Cooking. Makes Big Saving.

To get quick and satisfying relief from coughs due to colds, mix this recipe in your kitchen.

First, make a syrup with 2 cups granulated sugar and one cup of water. No cooking needed. Or you can use corn syrup or liquid honey, instead of sugar syrup.

Then get 2½ ounces of Pinex from any druggist. This is a special compound of proven ingredients, in concentrated form, well-known for its quick action on throat and bronchial irritations.

Put Pinex into a pint bottle, and fill up with your syrup. Thus you make a full pint of splendid medicine—about four times as much for your money. It never spoils, and tastes fine.

And for quick, blessed relief, it is surprising. You can feel it take hold in a way that means business. It loosens phlegm, soothes irritated membranes, eases soreness. Makes breathing easy, and lets you get restful sleep. Just try it, and if not pleased, your money will be refunded.

FOR EXTRA CONVENIENCE GET NEW READY-MIXED, READY-TO-USE PINEX!

## How OLD is Santa Claus?

This particular Santa—the one you see on the Christmas Seals—is a very healthy forty-five!

Yes, this is the 45th annual Christmas Seal Sale—a holiday custom that has helped save 5,000,000 lives. Yet, tuberculosis kills more people than all other infectious diseases combined.

So, please, send your contribution today.

## BUY Christmas Seals!

AGRICULTURIST

# Honesty—Is It THE BEST POLICY?

1. In your opinion is honesty increasing or declining in (a) business, (b) government, (c) athletics, (d) personal affairs?

2. Is there a definite correlation between honesty and (a) religion, (b) family training, (c) education?

3. Do you believe that every person has his or her price?

4. What kind of a country would you visualize if NO ONE could be trusted?

THE above questions, stimulated by the comment, "friendship came ahead of honor," made by one of the boys dropped from West Point, were submitted by your editors to a number of students in the New York State College of Agriculture.

We purposely avoided asking these young people their personal definition of honesty, but from what the West Pointers had to say, are we to believe that there are various degrees of honesty to be evaluated according to circumstances? If they place friendship ahead of honesty and saw a friend stealing and selling government property, would they report it? What would they do if they knew a friend committed murder?

But, let's get back to the answers which college students had to our questions: There was some variation in the opinions relative to honesty in the four fields mentioned in our first question. A sizeable majority felt there has been little change in business or personal honesty, but a smaller majority believed that honesty in government and athletics has been on the decline. Here are some comments:

"I agree that honesty is the foundation for freedom. On the whole, I believe America has a good foundation. I believe most people can be trusted on things that are really important."—Kenneth Heiler, Glenwood, New York.

"I find it difficult to make definite conclusions about honesty but it seems to me that it is just about static."—Charles Wheeler, Florida, New York.

"In general I think that honesty is fairly uniform, showing minor ups and downs in somewhat of a cycle. There seems to be less honesty in government now, but I believe this is due to failure to change office holders often enough to keep politicians on their toes. I feel that I can still justify my basic belief and trust in mankind."—Willard Loper, Freeville, N. Y.

### The Pessimistic Side

"I feel that dishonesty in government is increasing mainly due to the employees it hires. I have worked for a government agency and it always bothered me that it seemed almost impossible for any one to turn in a productive and really satisfying day's work."—(Not signed)

"We have always had dishonesty and probably always will. It is hard to judge whether it is increasing or decreasing, but recently the subject has been publicized more than it has in the past."—Conrad Oliver, Ithaca, N. Y.

"Honesty in business is declining. Businesses are getting larger and there are fewer check-ups. Politicians are becoming increasingly corrupt. In basketball some of the dishonesty is caused by failure to play games on the college courts."—Douglas Perkins, Cattaraugus, N. Y.

There was unanimous agreement that there is a correlation between honesty and family training, and a substantial majority believe there is a hook-up between honesty and education.

Richard Haner of Chatham Center, New York, says, "A good home means a good citizen."

Another commented, "I believe there is a definite correlation between religion, family training, education and honesty."

### What Price Honor?

Forty per cent of the young men believe that every person has a price. We wonder if that fact disturbs you. No one would claim that every person is incorruptible but certainly a viewpoint that everyone can be bought has a distinctly pessimistic tinge. Here are a few comments on both sides:

"No, I thoroughly believe that there are many people who cannot be bought at any price."

"There are some individuals who set the price of honesty far above any sum of money."

"I think the reason that it seems that more people can be bought now is that the newspapers and radio make an extra large thing every time some

"I firmly believe that the army of persons who urge greater and greater centralization of authority, and greater and greater dependence upon the Federal Treasury are really more dangerous to our form of government than any external threat that can possibly be arrayed against us."

— General Dwight Eisenhower.

player is bought, but every time a person refuses to be bought it is barely mentioned."

Here is the other side:

"Yes, everyone can be persuaded."

"I think that almost everyone gives in some time."

"Yes, when a person is in the right mood I think he can be bought out."

"Most every person will get what he desires at any cost."

"The willpower of a person controls the price at which he will turn to dishonesty."

"Definitely, but who can pay the price?"

### Chaos Without Trust

The students apparently had some difficulty in visualizing what it would mean to live in a country where no one could be trusted. However, that seems to be a logical conclusion if everyone has his price. Here are some of the comments:

"If no one could be trusted there would be many unwieldy controls." (But if everyone had his price who would do the controlling to keep us reasonably honest?)

"If no one could be trusted I wouldn't want to be around to see the result."

"It would result in a survival of the fittest. I would keep my back to the wall and be ready to fight anyone, anywhere."

"It would result in a country of the lowest order in which I surely would not want to live."

"It would result in a dictatorship of thought and action by someone who was able to get control of the country."

The Rev. Walter Dodds who discusses "The Truth Which Makes Man Free" on Page 55 of this issue, was in the Near East and India a year ago. He came back with the feeling that there is far more honesty in this country than we realize. "In some of the countries in which I traveled," he said, "set your grip down and turn around for a moment and it just isn't there when you go to pick it up."

## Retire?

### I'm Going to Have Some Fun!

In 8 more years I'll be 65. Then I'm going to do a lot of things I've wanted to do all my life—visit my brother, for example.

I might even retire. In fact, I can retire—on the comfortable income I'll be getting from my Farmers and Traders retirement policy.

You can do it too—if you start now. And you protect your family at the same time—all with one low-cost policy.

Mail the Coupon for Details.

### FARMERS AND TRADERS LIFE INSURANCE CO.

Syracuse 1, N. Y.

## NO NEED TO WEAR A TRUSS FOR RUPTURE

That Binds, Cuts, Gouges,  
Slips and Does Not Hold

If you must wear a Truss for Rupture, don't miss this. A Post Card, with name and address, is all you send to W. S. Rice, Inc., Dept. 65-P 13, Adams, N. Y., to get FREE, and without obligation, the complete, modernized Rice Plan of Reducible Rupture Control. Now in daily use by thousands who say they never dreamed possible such secure, dependable and comfortable rupture protection. Safely blocks rupture opening, prevents escape, without need for bulky, cumbersome Trusses, tormenting springs or harsh, gouging pad pressure. Regardless of how long ruptured, size, occupation, or trusses you have worn, TRY THIS, and send your Post Card today.

## Wake Up To More Comfort

Without Nagging Backaches

Nagging backache, loss of pep and energy, headaches and dizziness may be due to slow-down of kidney function. Doctors say good kidney function is very important to good health. When some everyday condition, such as stress and strain, causes this important function to slow down, many folks suffer nagging backache—feel miserable. Minor bladder irritations due to cold or wrong diet may cause getting up nights or frequent passages.

Don't neglect your kidneys if these conditions bother you. Try Doan's Pills—a mild diuretic. Used successfully by millions for over 50 years. It's amazing how many times Doan's give happy relief from these discomforts—help the 15 miles of kidney tubes and filters flush out waste. Get Doan's Pills today!

## AMERICAN AGRICULTURIST

**NORTH AMERICAN ACCIDENT INSURANCE COMPANY**  
GENERAL OFFICES 209 SOUTH LA SALLE STREET  
CHICAGO, ILLINOIS.

GEORGE F. MANZELMANN  
PRESIDENT

November 8, 1951

To Readers of AMERICAN AGRICULTURIST:

Your editor, Mr. Eastman, has told me that a major portion of this issue of your paper will be devoted to the proposition of preserving our American Way of Life.

I am for the American Way of Life--- because it honors and rewards individual initiative, thrift and hard work. It is the way of life which has made America the greatest country in the world. It is the way to keep America the strong leader for World Peace. It is the way to maintain security for the individual.

This company, now in its 65th year of service to policyholders, has been built strong and secure by individuals with high integrity, individual initiative, and an eagerness for hard work. We are proud of our achievements.

We are grateful for this opportunity to support AMERICAN AGRICULTURIST in its fight to maintain the American Way of Life.

Cordially yours,

*George F. Manzelmann*  
President

## A Recommended Choice

By TOM MILLIMAN

**F**OR almost two decades the federal government has been moving in on the farmer with handouts, price support, other handouts, crop controls and more handouts. As a former county agricultural agent and then farm cooperative worker for more than 30 years, this observer sees as its logical end nothing short of complete control over farmers and farming.

A period of 17 months of service at Washington in the war agencies in the early part of world war II clearly revealed the tremendous ambitions of bureaucrats in several departments of government, including AAA, for power over the farmer. Only the Soil Conservation Service and the bureaus of the Department of Agriculture devoted to research seemed to be free from the power virus.

Since then such fantastic exhibits as the Brannan Plan and other evidences serve to confirm the continuation of the trend. Socialism, which must always be accompanied by regimentation, is on the move and has been marching here for many years.

As always, since the founding of the Republic, farmers have the choice of looking to the government for guidance and support or of depending upon themselves, their State agricultural colleges, and upon proprietary and cooperative enterprises in determining which way to go. An examination of the opportunities at hand for increasing food production, farm income and enhancing the lot of the farmer will reveal the following as one of the prime choices in the Northeast.

### A New Frontier Right Here

Over 20% of the land included in farms in the 12 Northeastern states consists of neglected pastures. These are permanent, unplowed pastures which for the most part are on hill-sides or the rougher level land and continue without liming, manuring, fertilizing or mowing. According to the census, the total acreage of such pastures amounts to more than thirteen and one-third million acres for the 12 states with New York leading the procession with 4½ million acres. Actually the acreage is much greater for the reason that some of the pastures which are listed as rotated grazing

lands because they have been plowed within 7 years, are also neglected.

During the past year and more, great pains have been taken to obtain a consensus of fact and opinion on the yield of our neglected pastures. Combining the research findings at land grant colleges and the judgment of farmers the figure of ½ ton of timothy equivalent to the acre is a proper figure. Such yield is generally partly made up by weeds and is always poorly balanced toward spring growth, with almost no yield in mid-summer and far too little growth in the fall.

While it has been shown that liming, clipping, fertilizing and manuring such pastures will pay off in terms of cost, the gain as thousands of farmers have found is not enough to warrant much effort and expense in that direction. The continuing neglect of permanent pastures is good testimony toward the conclusion that surface treat-

This 7 toothed, wheeled field cultivator, with teeth spaced 12 inches apart, is, by crisscrossing, capable of destroying old sod while leaving trash on top to prevent erosion. The size shown requires a 3 plow tractor, and can also be used in place of an ordinary spring tooth harrow for regular tillage. This one is owned by James A. McConnell, Mansfield, Pa., and the man in the picture is Henry Beardsley, farm manager. Mr. McConnell intends to try this machine as a subsoiler and if necessary to reduce power requirement, will take off some of the teeth. The main purpose, however, is for pasture renovation. Price in fall 1951 was not over \$550. Although shown on corn stubble, this machine has torn up much old sod on hillside pastures this fall, in preparation for spring seeding to birdsfoot, etc.

ment does not bring enough rewards to warrant large-scale action.

Nothing short of tearing up and destroying the old sod and establishing a new and better sod will do. Authorities for many years have recommended plowing up and re-establishing old pastures. Very little happens and farmers are mostly right about ignoring the recommendations.

The plow can't be used in many of

these situations and in others only with extreme difficulty. Then, too, the plow leaves the soil ripe for erosion. Farmers like to plow in straight lines and will not do so at all if much of the plowed land is to be washed away.

The answer to this problem seems to lie in the machines pictured on this page and in other heavy duty machines of various makes. One which is not pictured here is the giant 10-disk harrow weighing 3,700 lbs. and requiring at least a 4-plow diesel crawler tractor to pull. Such a machine is available here and there for custom use and is very cheap at \$10 or \$12 per hour of use when turned loose on the less depleted of the neglected pastures.

### Minimum Increase

What may one expect to replace the half ton of weedy timothy yield on an acre?

Findings on farms and in research at many experiment stations give assurance that renovation with the old sod destroyed increases the yield threefold and upward when seeded with birdsfoot trefoil, either alone or with timothy. More than that, birdsfoot trefoil assures better mid-summer grazing and heavier fall yield when it is most important for dry stock, especially bred heifers.

The recommendation here made for renovation or reclaiming of old pastures runs into a measurable sum of money when carried out. The recommendation would not be made at all were it not for the fact that birdsfoot trefoil, unlike ladino clover and alfalfa with which the writer has had much experience, will remain indefinitely and continue to survive and yield when overgrazed and undergrazed. It will not be run out by grasses as is sure to happen with ladino when the latter is undergrazed or not clipped. There is no longer any question about the adaptability of birdsfoot trefoil to a wide range of soils including the most acid. Unlike alfalfa, it does not require the best drained soil and will persist when inadequately limed although it will do much better when properly fed.

Here, then, on more than 13 million acres is a simple program for responding to the call of the government for greater food production while insuring to ourselves greater prosperity. At Hayfields where every stroke of labor is on a paid basis, neglected pastures are too great a luxury to be supported and endured. Even so, after years of effort, we shall have left in 1952 a patch or two of old pasture too steep to work, and must either forget it or console ourselves with the thought that these few acres help to hold the world together.

Showing 2 plow tractor with mounted field cultivator, or toolbar tiller. Shoes or teeth bolted to the shanks are very narrow for use in sod. Wider teeth proved to be too much for the tractor when the tiller was lowered to the maximum for tearing up sod this fall. Wider shoes will be used for fitting plowed ground and corn stubble. The outfit as shown is practical enough as a pasture renovator. Although it will require a few more man hours than the other two machines pictured on this page, it will in fact tear up old sod to sufficient depth. In hardest ground where a penetration below plow sole is desired, some of the teeth should be removed. Price of this tool with two sets of shoes is under \$240 in fall 1951, delivered farm. Man in picture is the 32 year old manager of Hayfields, Marion Nobles, who automatically raises or lowers the tiller at finger's touch. Several makes of practical toolbar tillers are on the market, all priced about the same.

This rugged, simple inexpensive machine is a mighty tool for tearing up hillside and other roughland pasture sods, where plowing is difficult or impossible, for weathering through the winter without erosion to the end that birdsfoot trefoil will be seeded in the spring, after conventional tools have limed, fertilized and fitted the disked up ground. Weight of the disk harrow as pictured is 1420 lbs. Since then two concrete blocks of 300 lbs. each have been cast and fitted into the frames shown. Diameter of the disks is 24". The hydraulic connection shown permits the driver of the three plow tractor to adjust the angle of the disks from the seat. Price in September 1951 was \$329 delivered Hayfields and guaranteed. This machine has many other uses, including ordinary disking and the making of diversion ditches. Two near neighbors have already spoken for its use.

## The TRUTH That Makes Man Free

By WALTER DODDS,

Pastor, First Presbyterian Church,  
Ithaca, New York

**I**N this day of easy political and spiritual panaceas we can learn much from the old Third Reader story about the misguided caterpillar in the cocoon. The caterpillar's name was Johnny and his goal in life was to be a butterfly. He was being cared for by a little boy, Harry, who kept him in a box in his room.

Walter Dodds

About the time Johnny was to become a real butterfly, he and Harry began to worry about whether or not he could ever get out of the hard tight prison of his cocoon shell, and so Johnny cried out to Harry:

"Please get me out of here, I'll never make it on my own."

Harry, being a kind little boy, cut the shell of the cocoon and let Johnny out, only to find that Johnny died as the result of the operation. He needed the struggle to build up his body to the place that it could care for itself when he was finally free.

So it is today: American freedom is in danger because of the growing belief that freedom is something given and not earned. Freedom is something that cannot be given by either a Harry of the Third Reader or one in Washington. It must be earned.

This thesis that freedom must be earned is proved by two facts: religion, and the history of American political institutions. We must never forget that American Democracy grew out of a set of religious convictions about man. First, the belief that man is a free agent capable of finding truth for himself and voting accordingly. Second, the belief that man is a sinner and as such needs to be checked by his fellow men; hence our political system of checks and balances. The price of freedom is the eternal struggle between ruler and ruled, both of whom with constant vigilance must watch the other.

The deepest difference between communism and our form of democracy is not in our idea of property, but in our doctrine of the place of the individual as a sinful person who must be checked, and as an individual who can and must determine truth for himself. The Communists present a "party-line" from above, which the ordinary follower may not question. The American idea suspects all party-lines and demands that the individual govern and work out his own destiny.

Our very system of checks and balances makes us suspicious of help from above and demands effort and responsibility from each individual.

This, after all, is religion, the religion of Jesus. It was out of the background of such religious thinking that American Democracy was born. When we get away from religion, Democracy's roots will be cut off and we will die like a cut flower.

Freedom is earned by knowing and living the truth that makes man free. Jesus lost his life fighting authoritarianism from above, but He lives on in those who live as He did, according to the leadings of a conscience attuned to God's truth and righteousness and taking responsibility for their time as He on the Cross took responsibility for His.

## This Iowa Farmer Says—

## "WHERE OTHER TIRES HANG UP

# Firestone

## CHAMPIONS

## GO RIGHT ON THROUGH"

"I farm 210 acres of black loam, and for the kind of soil conditions I have, I like these Firestone Champions best. When the ground is hard, they bite in and take a good hold—and when it's soft, they take me through where other tires hang up."

W. E. WEDEMEYER, DONAHUE, IOWA.

**M**ORE AND MORE farmers are switching to Firestone Champion Open Center Tires—and glad of it! They find that the bars take a sharper bite because they're tapered, take a stronger hold because they're curved. And, because the tread of this tire is wider and flatter, it has more bar rubber to grip the soil for extra traction, more bar rubber to stand up on the road for extra traction life.

Try a set of Firestone Champion Open Centers on your tractor. Or, if you prefer Firestone Champion Traction Center Tires for your soil conditions, you can get them, too. Only Firestone offers you a choice between the most advanced Open Center and the one and only Traction Center Tire on the market today.

## One way freedom is earned...

**E**ARNING greater freedom is what progressive farmers and businessmen are doing every day.

When you take products or management methods that are the best there are, and put ideas, time, and money into improving them, then you earn greater freedom for yourself and often for millions of others.

Marvel at the strides your poultry and live-stock breeders have made in improving quality and performance. See the yields from the hybrid seed, the disease-resistant and high-producing varieties.

Notice the many ways in which soil conservation and soil management have increased yields. American farmers have gone from freedom to greater freedom—all earned by years of effort.

The progress of farm mechanization has been amazing, too. Right along with increased use of tractors, trucks, and other machinery has come steadily increasing development of better petroleum products for powering them.

Here at Gulf one of our basic policies is to produce improved products for farmers. Our facilities for research and development are considered among the finest in the petroleum industry.

That's how far we have gone in our aim to help you to have greater efficiency for your machinery.

That's how we, too, try to earn greater freedom for you and for us—by making the best products we know how at a fair price—and improving them constantly.

GULF OIL CORPORATION  
GULF REFINING COMPANY

## Christmas Dinner at Grandfather's\*

By Carl E. Ladd

**P**ARTNER, I don't want to be inquisitive, but are you sure you got an adequate supply of Vitamins A and D when you were young? Sometimes you look a little rickety to me. And how about vitamins B and B1? Did you have sufficient calcium in your diet and what about the leafy vegetables in winter? Are you sure that your diet was well balanced? Shucks. I'll bet you never heard the word diet and couldn't spell nutrition, and why should you? Little vitamins were lying all around you and you never saw them; protective foods were in the cellar and you ate them unscientifically. But we all knew that we lacked something in the spring, and how we did enjoy cowslips, dandelions, scurvy-grass, and twenty other early plants that mother cooked for greens!

We had a good many colds, though. Remember that shiny spot on your coat sleeve that was such a quick and efficient substitute for a handkerchief? But for those who were not too improvident, food was plentiful and its very abundance and natural unprocessed state gave us much protection. And how we ate—Grandmother said we were “hollow to our toes,” and Grandfather said we could “get outside of more victuals” than any boys he ever saw.

I don't think Grandmother and Grandfather ever invited us especially for Christmas dinner. They didn't need to; it was understood that we would be there.

This year the snows and cold weather started early. We were glad, for a “green Christmas makes fat graveyards,” and anyhow it was winter time, so let's have winter. Christmas morning was cold and I delayed under the warm covers a minute while my older brother jumped out of bed and dressed on the run to the stairway. It always seemed to me that he just threw his shirt and pants into the air and jumped into them before they settled to the floor. I am sure that he never stopped moving on his way to the stairs except to give his socks a quick pull over his feet. Of course, he had stayed in his underdrawers, and the first stop for that morning

dash was the sheet iron stove in the “sitting room” where time could be taken to put on our boots in a more leisurely fashion, get down cap, coat, muffler, and mittens and be dressed for the barn.

Chores were soon over, for we dried up the cows in the late fall and only had to milk the old “farrow” cow that was retained to keep the family in milk until cows began to freshen in the spring. Of course, there was hay or corn stalks to be fed to the cows, and the horses had to have some ear corn in addition to the hay, but we didn't clean the stables until after breakfast.

We all went a little light on breakfast that day even though our Christmas dinner wouldn't be ready until mid-afternoon. Then dad hitched Tom and Fan to the big double bobs and we all climbed in. There was deep straw in the bottom and two hard board seats. Our next neighbor was more prosperous and had a new spring seat that could be put on the lumber wagon or the sleigh box, but our seats were simply inch boards with cleats on the end so that they wouldn't slip sideways and let one end drop down. Father and brother sat on the front seat with a buffalo robe over them. Mother and sister crowded together on the back seat with a horse blanket reinforced with an old bed comforter over their knees and a soapstone under their feet. I sat in the straw just behind the second seat with a blanket over me, sheltered from the wind by the women, and I was the most comfortable of the lot.

The snow was deep and the track not too well

broken out, but Dad drove the two miles in about half an hour and we arrived at Grandfather's at about the same time as the uncles and aunts with their families. Grandfather had four children already married and bringing home about ten children, besides two old maid daughters and one unmarried son at home. To boys and girls, Grandfather's farm is always a wonderful place, but a couple of old maid aunts and a bachelor uncle just about make it perfect.

Aunt Mary yelled “Merry Christmas” and so did all the rest, but as I bent over in the sleigh trying to get the soapstone, a hard-packed snowball stung me in the seat of the pants, so I knew Aunt Em, the tomboy of the family, was starting her usual tricks on the boys. Grandmother was large and fat with the motherliness that comes from seven children. I can never think of her without being reminded of pies—mince, apple, pumpkin, and elderberry with paper thin white crusts baked in yellow crockery pieplates.

Grandfather had long brown whiskers and didn't talk much. All of his children held him in great respect and somewhat in awe. He was a short, slightly built man who never lost his poise or got excited. We thought he quelled the ugly bull by sheer willpower, and I can still see him walking unconcernedly past the old ugly gander. No notice would be given even when the old gander held on to his coat tail and braced his feet. I always took a broom or club as a weapon, and often a trip to the barn was accompanied by a pitched battle with the old gander.

Grandfather didn't have a fireplace. Two old ones had been closed up and plastered over because they were drafty, and sheet iron stoves were more modern and much more comfortable. We warmed ourselves at the big stove in the sitting room, then raced into the parlor where the fire had just been

(Continued on Page 14)

\*Reprinted from the book “Growing Up in the Horse and Buggy Days,” by the late Dr. Carl E. Ladd, former Dean of the College of Agriculture at Cornell University, and E. R. Eastman, Editor of AMERICAN AGRICULTURIST. The book is in the form of conversations between the two authors, or “partners” as they called themselves. This particular chapter from the book was written by Carl, and we are reprinting it now because it is filled with the spirit of Christmas and brings back experiences that most of us have had in visiting “Grandpa's house.”

**Best  
Chicks  
yet**

**... you can  
buy them  
close to home**

**R**IGHT here in New York, New Jersey and Pennsylvania we have men who have bred and selected their poultry breeding stock so well that their birds stand up with those anywhere in the world. These hatcherymen are turning out chicks right now that grow bigger faster and, as layers, can produce more eggs than the birds of fifteen years ago. Many of these hatcherymen are G.L.F. members and live close to you.

#### **Nearby Chicks are Tops**

Chicks from nearby hatcheries are not only among the best in the world, but they just naturally receive better care, and run less chance of being chilled and weakened from long trips than those shipped long distances. Because they are nearby, you can know the hatcherymen personally and visit with them about your chicks. This year, buy your chicks from one of the good northeastern hatcheries. Cooperative G.L.F. Exchange, Inc., Ithaca, N.Y.

**Some of the best chicks in the world are  
produced in G.L.F. Territory**

No. 4:

## What Can I Do?

By E. R. EASTMAN

REFERRING particularly this time to you, Mr. Dairyman, and to your wife and family, here is what you can do:

First, you can stop using oleo in your own family.

Second, you can watch your newspaper for articles and letters urging the repeal of the laws banning colored oleo, and either talk to your editor personally or write him a letter giving him your point of view.

Third, you can tell your assemblyman and senator, either through a personal talk or by letter, how emphatically you feel about the attempt of the oleo manufacturers to steal butter's natural trademark, its yellow color.

The oleo manufacturers have no more right to make their product look like butter by stealing butter's yellow color than they would have to steal and sell a copyrighted book or article or to manufacture and sell a patented machine. For generations, yellow has been recognized as butter's trademark, and that is sufficient reason for objecting to the same color for a competing product. Of course, butter manufacturers sometimes add color, but butter is always naturally yellow. Color is only used to make the yellow uniform.

Nutritionists agree that the yellow

color has no bearing on the flavor or nutritive quality of oleo. Why shouldn't oleo stand on its own feet? Why shouldn't it be sold for what it is? Why should oleo manufacturers deceive the people by making oleo look like butter? White is not an objectionable color, in fact, it is generally recognized as a symbol of purity.

Tremendous pressure is being brought on consumers right now to get the ban on colored oleo repealed in all the states where the ban still exists. Housewives have received a cleverly written propaganda folder, signed by a so-called "citizens' committee," urging the repeal of the laws against coloring oleo. It is reported on good authority that the cost of printing and distributing such folders is paid for by the oleo industry.

We farmers are constantly on the losing end because we sit by and take no action. But, believe me, our opponents and competitors never miss an opportunity to press their case with the lawmakers.

What can you do? If you are a dairyman, you can watch this oleo situation and object vigorously to any attempt to steal your trademark. Your legislators and newspapers will listen if you care enough about your business to fight for it.

## Apples for Man and Beast

By E. STUART HUBBARD

INFORMATION is accumulating of the values of apples in the diet. Recently, I called on my old friend Robert Blaustein of Wallkill, New York, a retired sea captain. For many years we have sold his fine pack of beautiful apples for him.

"Do you know why I planted this apple orchard?" he asked. "Years ago, I was a sailor on a ship in South African waters. I became very ill with dysentery. The ship doctor could not check it. I tried a native African doctor without success. Then the doctor from a German ship cured the dysentery but left me with chronic constipation."

"Finally I reached New York where I spent some time in the sanitarium of Bernarr Macfadden. He put me on an apple diet which cured me. And so, in thankfulness to the apple, I bought this farm and planted this apple orchard."

Mr. Blaustein, now 84 years old, still operates his orchard with the help of his young wife and their sixteen year old son.

In The Feed Lot. A leading Ohio apple grower and livestock raiser told

me, during the bus ride in Missouri at the National Apple Institute meeting this June, that they fed 16,000 bushels of apples to 160 head of cattle some six years ago. The apples were ripe and mellow so he fed them whole. He fed at the rate of a bushel and a quarter a day.

The feed-lot animals made good gains. This stockman cautioned, however, that apples should be kept from animals for at least three weeks before slaughtering, if one wishes to keep friends with the butcher, as an apple diet turns the meat unattractively dark in color. The flavor is not affected, he said.

Apple Pomace. Many growers report excellent results feeding apple pomace as a supplement or substitute for silage for dairy or beef cattle. One dairyman fed apple pomace from a pile three years old with good results.

The table below from the Extension Service of Massachusetts showing comparative feed values of various materials, indicates that apple pomace has a lower cost per T.D.N. unit, at the nominal cost usual at nearby mills, than any other feed.

	Approx. Cost/ton	Cost/cwt.	Lbs. T.D.N. per cwt.	T.D.N. cost/cwt.
Apple Pomace*	\$ 4.00	\$.20	16	\$1.25
Brewers' grain (wet)*	.35 Bu.	.64	16	4.00
Good mixed hay* (40-50% clover)	40.00	2.00	50	4.00
Good Alfalfa** (2nd cutting)	51.00	2.25	53	4.81
Dried Citrus pulp*	73.00	3.65	74	4.93
Corn meal*	90.00	4.50	81	5.55
Wheat bran**	77.00	3.85	67	5.74
Ground oats*	83.00	4.15	70	5.93

## A CHRISTMAS STORY

ONCE upon a time, when I was maybe about five years old, I hired out to do farm chores and other important (?) work for my father for \$30 a month. Now, you might think that that was pretty good pay for a five-year-old, but like some other deals I have known since, there was "a nigger in the woodpile." I agreed to pay Father \$29 a month for my board!

But even though my net profit for my month's work was only \$1, it was the biggest and most important dollar I ever earned. Mother went with me down to the little village store to help me pick out Christmas presents. If you are over fifty and a countryman, you can close your eyes and still remember and smell the delicious and exciting odors of an old-time country store. The smells of the rubber boots and clothing mingled pleasantly with those of the groceries, especially the cheese and the coffee, and all were well seasoned with the tobacco smoke from the loafers around the big pot-bellied stove. You'll remember, too, how the old storekeeper tried to "gay up" his store at Christmas time with a few oranges, some bright sticks of candy, and maybe just a few toys.

Gone is any memory of what I bought with my dollar. In those days mothers knew how to stretch a dollar a long, long way. I only know that we made my dollar buy something for Father, Mother, and my three brothers, Charlie, Dufay and Albert. Many pleasant and beautiful Christmas days have come and gone since that one, my first big Christmas, but none shines brighter across the years. The reason that I remember it so well is, I am sure, that I used my great big dollar to give something to those I loved. Nothing truer was ever said than "It is more blessed to give than to receive."

## CONGRATULATIONS, FARMERS!

AT THE annual meeting of the New York State Farm Bureau Federation this fall a resolution was introduced that farmers should be included under the social security law. Speakers from the floor instantly and emphatically objected, and the resolution was defeated by a heavy majority. The New York State Grange and other farm organizations are also on record against compulsory social security for farmers.

This attitude of northeastern farmers against all forms of government handouts such as subsidies, free lime and fertilizer, and compulsory social security, is most encouraging. It indicates that farm folks are well aware that "you cannot eat your cake and have it, too," and that one cannot take government handouts without giving in exchange our precious right to run our own business.

## SOME DECEMBER JOBS

WHAT a difference the season of year makes in our way of life, particularly that of farmers! Last night it was dark at our place at five o'clock. In June it wouldn't be dark until nearly nine, four hours later. But those long evenings have some advantages, the best of which is that they bring the family closer together around the fireplace and the reading table.

Another advantage of the long evenings is that they give a good farmer an opportunity to start planning his campaign for the year ahead. It's not too soon right now to plan what you will need in the way of fertilizer, seed and other supplies, and get your order in. In these times of wartime shortages, if you wait you may be disappointed.

The same suggestion goes for taking an inventory of your farm machinery. Early in the winter you can find out what repairs you need and get the repair work done. Painting the machinery is good insurance, also.

The end of the year is the time to make sure that

*By E. R. Eastman*

your records are in shape for your income tax report. Every good farmer now takes an inventory at the beginning of the year. Times have changed and farming is a business involving a big capital investment. It is plain common sense to know how you stand by taking an inventory.

What about your fire insurance? Have you read your policy lately? Values have changed. How would you stand on insurance if you should have a fire?

And speaking of fires, this is the time when hot stove pipes and chimneys and overloaded electrical wires with their danger of short circuits could start a disastrous fire. Isn't it a good idea for you to take a few minutes off to make a fire hazard check?

## MORE EQUIPMENT FOR MOTHER

YOU farm women will be called on to help with the outside farm work more than ever during the coming year. The U. S. Department of Agriculture reports that young people and hired men are leaving the farms in great numbers, not only to join the Army but to take city jobs with their big wages.

On hundreds of farms, that leaves Father alone to carry on a two or three-man job, with what help Mother can give him on top of her own many household duties. Therefore, if Father expects Mother to ride the tractor and help with the milking machine, I hope he will be liberal and considerate in helping her to get all the labor-saving equipment that is practical to lighten her household labors. Both on the farm and in the home, about the only answer to the labor shortage is good equipment.

## DID YOU READ IT?

"Congratulations on your Fourth Forum Issue of the AMERICAN AGRICULTURIST. I have read it from cover to cover and sincerely hope that many more people will do the same. Perhaps it will pave the way for a better America."—W. F., N. Y.

I have just finished reading the Forum Issue, and I want to congratulate you. I hope it serves to stir people out of their complacency. If something does not jolt them soon, I am very much afraid of what the next turn of the wheel will bring."—H. W., N. Y.

THE above letters are typical of the many encouraging ones that are coming in about our December 1st issue, the most important issue we ever published. If you haven't read it, won't you look it up, and then save it or send it to a friend? Do this, not for our sake but for the good of America. And be sure to read the statement on Page 12 of this issue.

## A SUGGESTION

THE members of the editorial staff of AMERICAN AGRICULTURIST are unanimous and emphatic in their belief that Mr. Eastman's latest book, NO DRUMS, which is just off the press, is the best story he has ever written. You will agree that that is saying a lot if you have had the privilege of reading some of his other books, like TOUGH SOD, THE DESTROYERS and THE SETTLERS.

Even if you read NO DRUMS in serial form in AMERICAN AGRICULTURIST, you will want to get the story in book form. In the serial, it was necessary to condense it and the book is much longer. Everyone in your family, boys and girls, father and mother, will be intensely interested in this story, told in dramatic and thrilling form, of how people worked and worried in the farm homes and on the battlefield under the great strain and emotions of wartime.

We are sure that you can find no better Christmas

present for your family and your friends than this exceptionally fine novel, NO DRUMS. To get it, send \$3.00 for each copy wanted to AMERICAN AGRICULTURIST, Department ND, Savings Bank Building, Ithaca, New York, and the copies will be sent postpaid.—H.L.C.

## MORE EMPHASIS ON MORAL AND SPIRITUAL VALUES

THE New York State Board of Regents at its November meeting unanimously adopted a statement proposing that every school day be opened with prayer. The Regents said that they were convinced that "the fundamental belief of dependence upon Almighty God is the best security against the dangers of these difficult days."

The Regents also recommended that the school day might well include specific programs stressing the moral and spiritual heritage which is America's, and that "love for God, for parents and for home among children is the best way of insuring that this government and our way of life shall not perish from the earth."

The Regents' statement has met so far almost universal approval. People are becoming increasingly aware of the need for more emphasis on moral and spiritual values in the school, in the home, and in all other walks of life. In material blessings, Americans have more today than our forefathers ever dreamed of, but spiritually we are lagging far, far behind.

## PASTURES ARE EARLIER

ONE cannot ride through any neighborhood or dairy country early in the spring without seeing many green pastures that have been improved. Hundreds of farmers who once had to wait until the middle of May or later now have their cows at pasture at least two weeks earlier. These same pastures stay good right through the dry months and two weeks later than they once did in the fall.

How the legumes show up in the meadows, too! Before many months it will again be time to put up grass silage.

## EASTMAN'S CHESTNUT

THIS year there are a lot of deer-hunting stories going around, some of them funny and some not so funny. One of the best is the true story of what happened to a husband living near Ithaca who refused to let his wife go with him when he started out in the early morning to get a deer.

"Oh no," he said. "I'm not going to drag any woman along and spoil all my chances!"

This made his wife angry, so she went hunting on her own, shot a deer weighing 175 lbs., and got some help to get it home. Along about dark the husband came dragging in, tired, discouraged, empty-handed. I don't think his mood was helped much when his wife confronted him with her trophy!

My neighbor told me another true story that happened to him this year. He was walking through the woods with a state policeman who was helping the game wardens enforce the game regulations. The neighbor and the officer met a little man, pretty well bushed, who said he had shot a deer and asked my friend and the officer if they wouldn't help him get the deer to his car. He started to lead them toward the deer, and suddenly they met two men dragging a deer toward them. The little man claimed that that was his deer, and an argument followed. Finally, the policeman said to the little man:

"Can you prove that this deer is yours?"

"I certainly can," he shouted. Stepping up to the deer he pried its mouth open and reaching down into its throat he pulled out his own license. The policeman took the two men away, and the newspaper reported later that they paid \$75 apiece for stealing a deer.

# AA's Farmers' Dollar Guide

**INCOME TAX:** Taxes on farm income are higher. The 1950 law brought an increase, and the 1951 law another increase for the last 2 months of '51 (and succeeding years unless it is changed). Most states have a bulletin which gives the latest facts on income tax for farmers. Get one from your county agent, or send to the mailing room at your State College of Agriculture (see question 1 on page 7 for new provision on sale of animals).

Now is the time to think about starting a set of books for 1952. Income tax regulations are making it increasingly important to have adequate records. For one thing, if your report is questioned, it can be embarrassing if you don't have records to back up your statements. The first step is to take a complete farm inventory around January 1.

**FEED:** In relation to livestock on farms, the total feed-grain supply is 7 to 10 per cent smaller than it has been in the last 3 years. The corn crop may be nearer 2.8 billion bushels of good corn than USDA November estimate of 3.08 billion bushels. Moisture content is high, which reduces feed value. Wheat crop fell below a billion bushels for the first time since '43. It is 3 per cent below last year.

**DRAFT:** Deferment for farm or other essential workers will be more difficult to maintain as time goes on. One reason is the policy of rotation; that is, not leaving soldiers in Korea indefinitely. Married men under 26 without children are now subject to induction. If such men are farming and deferment is wanted by them or by you as an employer, fill out Form OF-4, add detailed information and file with local Draft Board. If you have occupational deferment (2-A or 2-C), you will remain subject to induction after you reach 26 and until you are 35, regardless of the number of your dependents.

**GOALS:** Farmers will be urged by the USDA to increase production in 1952. If prices drop or threaten to drop, higher price supports or subsidies are likely to be offered as incentives. Such devices are costly and too often bring too much of the wrong product. The hope of a reasonable profit in a free market without dangers of price ceilings will encourage adequate production. If price supports are offered, farm organizations have asked that they be at low levels as insurance against disaster rather than at levels which encourage unneeded production.

Some people worry about the danger of lower prices if farmers produce a little more than we need. The flexibility of our animal agriculture will take care of this better than government planners. If we run short, more animals can be eaten, as well as the wheat and corn that these animals would have consumed; then demand ups the price and farmers are willing to gamble on increased production. The Free Enterprise System is not perfect, but it comes far closer than government planning and controls as they work out in practice.

**PLANS:** Here are some things to think about as you make plans for the coming year: Raising your own calves is a big step toward disease control in the milking herd. Raising them at moderate cost is important too. If you haven't been satisfied with the results, why not do some studying and analyzing to see what's wrong?

Are you feeding the right amount of grain and the right protein analysis to get the fullest possible results from the roughage you have? Are the cows giving the most milk getting the most grain?

One pound of superphosphate per day in the stable not only increases the value of manure but prevents slipping and adds greatly to the appearance of the stable when visitors drop in.

Is your ventilation system working satisfactorily? A poorly ventilated barn is uncomfortable and can cause rapid deterioration of the barn.

Custom work is increasing. Depending on the situation on your farm, you may want to hire more custom work done or you may want to buy equipment and do custom work for neighbors. Custom work can be used to smooth out the high or low spots in your work. —Hugh Cosline

## The Song of the Lazy Farmer

IT'S DANGEROUS as all get out for anyone to roam about when snow is piled upon the ground and icy spots are all around. If you are short of wind and old, you shouldn't go out in the cold; you're apt to get your ears nipped off, you'll probably pick up a cough, and if you wade through knee-deep snow, a heart attack might lay you low. But even if you miss that fate, you prob'ly won't have long to wait before you skid upon the ice and get a bump or break or slice which either fixes you for good or hurts so bad you wish it would.

In winter-time, the place to be is right where you'll be finding me from now until the song-birds fly, I'm staying where it's warm and dry. I've fin'ly got Mirandy sold, she's now convinced that ice and cold are things that I should stay out of or else she'll have no man to love. To make her realize it, though, I had to stay out in the snow 'til lips were blue and ears were white.

And then, to do the job up right, I slipped so I would bump my head, and when she saw me nearly dead she then agreed to my desire to stay indoors beside the fire.

# Ask your druggist for these 2 proved treatments for MASTITIS

## NOTE THE THOROUGH DISPERSION OF SQUIBB OINTMENT IN A TREATED QUARTER SQUIBB PENDISTRIN\*

Each tube of Squibb PENDISTRIN contains 100,000 units of penicillin plus 100 mg. of dihydrostreptomycin. This potent combination of antibiotics makes PENDISTRIN especially effective for nearly all kinds of mastitis cases—and particularly those caused by Staphylococci. PENDISTRIN is stable, non-irritating, won't discolor milk. It comes in the "instant-use" tube—requires no refrigeration.

## SQUIBB PENICILLIN OINTMENT

This is now a 3-year success in treating 9 out of 10 cases of mastitis (those caused by Streptococcus Agalactiae). Millions of cases have been successfully treated. This product is stable, non-irritating, won't discolor milk. Write for special literature on PENDISTRIN and PENICILLIN OINTMENT. E. R. Squibb & Sons, Veterinary and Animal Feeding Products Division, Dept. AA-12,745 Fifth Avenue, New York 22, N. Y.

For accurate diagnosis of mastitis, consult your veterinarian.

One Man Chain Saw

Less  
Down Time  
Than Any  
Other Saw

More Power Per  
Pound Than Any  
Other Saw

There are two big plus factors in favor of a Homelite Chain Saw. First, it's the only saw weighing as little as 27 pounds that has a 4 horsepower engine. And second, field tests under severe operating conditions have clearly shown that a Homelite needs less down time for maintenance or sharpening than any other saw.

Put these factors together and you get everything you want in a saw . . . easier handling, faster cutting and lower maintenance cost. Built and backed by Homelite, manufacturers of more than 300,000 gasoline engine driven units, this saw will perform easily and perfectly on every type of cut. Try it once and you'll use it always. Above are two rows of seed on which germination tests have been made. The row at the left was treated as a protection from disease and, as you can see, has sprouted vigorously. The seed in the row at the right was not treated and the difference is striking.

—Photos Courtesy Dupont

## Seed Treatment Pays

**W**HAT it costs in time, gasoline, machinery wear and hard work to plow and fit a new seed bed is only too well known. In fact, it is one of the reasons why farmers, especially dairy farmers, are always anxious to find long-lived perennial crops. It is also why all farmers seek high yielding annual crops to bring in the most money for the time and energy invested in fitting and fertilizing the land and harvesting the crop.

With all costs up, it is good insur-

decay organisms before you buy it.

It is very important to check with your supplier to see whether the seed you purchase has been treated. If it has not, then you can do it yourself with relative ease and at low cost when you consider the insurance value of the treatment.

For cereal grains, a homemade seed treater constructed from an old oil drum can be used, and in the case of vegetable and flower seeds, treatment is often made by putting the seed and the proper chemical for the treatment in a glass jar and shaking it vigorously. We believe the photos on this page demonstrate the extra yield that can be anticipated by those who buy treated seed or spend a little extra to treat it themselves before planting.

Above is a sprouted grain of wheat which was treated and is vigorous and healthy. The seed below (not treated) has been attacked by a fungus. Even though it has survived, its growth has been retarded.

Above is a grain of wheat which was destroyed by smut during the growing season and is a total loss. Below is a grain of wheat which escaped smut and other enemies. It was planted but rotted in the ground before it germinated, a situation which could have been prevented by seed treatment.

ance to take advantage of every practice that helps to produce a bumper crop. Seed and fertilizer, for instance, are more expensive than they were a decade ago, but if the seed fails to sprout or is killed after it germinates, the cost of the seed is lost as well as the labor and time that you have put on the crop. At least a portion of the fertilizer is also lost.

There is no such thing as cheap seed, because the few dollars saved on the investment for it can mean many dollars lost by a poor yield or weedy conditions.

But even the best seed in the best fitted piece of land has enemies that attack it, and that is why more and more of the seed you buy has been treated to control various diseases and

## Question Box

Can you give me the highlights relative to the payment of income tax on animals sold?

There has been a change. Now you need to pay income tax on only 50 per cent of the sale price of certain animals.

These animals include all dairy animals, all breeding animals, and all work animals. However, you must have owned the animals for at least 12 months and they must have been owned by you for draft, breeding, and dairy purposes, and not primarily for sale.

You seem to favor reduction or elimination of PMA payments. Do you think that if this were done our taxes would be lower?

Taxes for all of us, both in the country and city, are going to stay high for some time. But just because a member of a family must have a costly operation to save his life, it does not justify his going out and buying an automobile that the family can't afford.

Cutting down on government spending that is not absolutely essential is necessary to balance or more nearly balance the budget.

What would you recommend for a seeding mixture for hay? Orchard grass makes a very good growth but is it good for hay?

You mention orchard grass. This is ordinarily a poor grass for hay in this area since it ripens very early and soon becomes tough and woody. It is, however, an excellent grass to seed in combination with ladino clover for pasture.

Not knowing too much about the kind of soil you have on your farm, I'll have to suggest a general mixture. This mixture is the one generally known as the Cornell General Purpose Mixture consisting of about 4 pounds of alfalfa, 4 pounds of medium red clover, 1 pound of ladino clover, and 6 pounds of timothy per acre.

Adequate lime should be applied prior to seeding, and if you have not had your soil tested for lime requirement I would suggest that you take a sample to the county agricultural agent and he will test it for you.

—George Serviss

What can you tell me about ranger alfalfa? Will it yield better than other varieties?

Ranger alfalfa, which was developed by the USDA, will yield better under certain conditions, primarily because it is resistant to bacterial wilt. It won't always yield more on soil which is not especially well suited for alfalfa and where the seedings are to be left for only 2 or 3 years.

Naturally it sells for a higher price and is recommended for the best adapted soils where you expect to leave it down for a number of years. Seed supplies are expected to be adequate to meet the demand.

Please let me know what I can do for carpet beetles? I have them around a large 12x26-foot rug which is new, and I would like to kill them before they eat up my rug.

Moth and beetle-proof both sides of this, and all other rugs and carpets, by spraying with a DDT, stainless type of Fly Spray (sold at most drug and grocery stores). Used with care it will not spot or stain, and used thoroughly it will control all insects for about twelve months. I buy a concentrated DDT and add some to the regular fly spray to make sure it is good and strong.—E. M.

# Count on finer crops with Swift's chemically hitched *Blenn* and *Brimm*

## New process *Blenn*

Swift's specialized crop maker for soybeans, corn, small grains or any special crop you grow. *BLENN's* fortified growth elements are chemically hitched in each granule. Your crops are fed uniformly. Your soil plus *BLENN* gives the growing plants all the nourishment they need all through the season.

Use *BLENN* to make the most from every acre planted. Costs per unit produced go down as yields and quality increase. And lower production costs mean that *BLENN* is a wise investment... never an expense.

## New process *Brimm*

Also made to supplement soil nutrients, *BRIMM* is another specialized crop maker. Made in plants located in various sections of the country, *BRIMM* contains chemically hitched growth elements balanced to meet the needs of special crops and soils. It is great for truck crops in the East, Southwest and Pacific areas. For cotton and corn in the South, there is no finer plant food than *BRIMM*.

Both *BLENN* and *BRIMM* are made by Swift's New Process. This means they have superior mechanical condition. They store well... distribute through your machines uniformly... no caking, lumping, or bridging... and, most important, the chemically hitched, fortified growth elements feed your crops evenly for uniform, high yields.

# Buy at the sign of the Red Steer

**RED STEER** comes in many analyses to meet the needs of your crops and soil. Ask your Authorized Swift Agent or dealer about Swift's Red Steer, the reliable plant food for general crops. Also, Red Steer Pasture Special.

**320 RESULTS!**

**...7 acres filled my silo!"**

*"Best corn I ever raised—7 acres of Robson 320 filled my silo. It has always taken 10 acres when I have grown other hybrids."*  
P. Henry Flynn,  
Penn Yan (Yates Co.), N. Y.

In 1951 our production of Robson 320 was increased over 15 times. Even with this big increase we were barely able to keep up with the increased demand, and reports from growers again bear out our claim that we have produced a new field corn hybrid superior to any other hybrids now being grown on New York dairy farms.

## Weather, Prices and News

By L. B. Skeffington

**N**OVEMBER provided a wide variation of weather for up-state farmers and had its effect upon farm work and in some instances, upon prices. A long spell of fair weather through October saw harvests pretty well completed, except for corn, cabbage, and, in spots, a few other crops. A lot of farmers figured on starting to cut cabbage after Election Day, but about this time temperatures dropped to the 10-15 range.

The potato market continued to stiffen; cabbage prices shot up. Apples which had been in the doldrums showed considerable strength with the change of weather and reduction in crop estimates. Snow and ice halted corn-picking, but helped to relieve water shortage.

### Farmers Sue County

A number of farmers in Yates County have retained attorneys to press action against the county for damages resulting from use of sprays to kill roadside brush. It is claimed that grapes, berries and other vegetation were killed or injured seriously when the spray drifted over a wide area.

### Builds Farm Storage

Marion I. Johnson, Williamson fruit grower and treasurer of the State Farm Bureau Federation, has found a way to cut costs of cold storage for his apples. The commercial rate locally is 25 cents a bushel. Johnson usually stores about 25,000 bushels. Largely by using farm help in spare time, he has converted an old barn into a cold storage. He says that to date it has cost him about 2½ cents per bushel to store 13,000 bushels so far this season. He estimates it costs him less than a cent a month per bushel to operate the storage and cooling plant. Johnson thinks enough of his plant so that he plans to double its capacity by building an addition.

### Farm Values Stable

At a regional meeting of National Farm Loan Association directors in Rochester, H. B. Munger, president of the Federal Land Bank of Springfield, said Northeast farm realty values have remained fairly stable. He said that farmers generally are "in pretty good shape"; that they are paying off loans as fast as they fall due; and that there has been far less inflation in farm real estate than in personal property.

By the end of the year, Munger said, 20 of the 35 Production Credit associations in the Northeast will have paid off all government investment. Peak government ownership of 5½ million dollars now has been reduced to \$300,000.

"There is not a dollar of government money in the Land Bank; farmers own it completely," he said. Illustrating the soundness of farmers' investment in the Springfield bank, he said their investment in stock totals three and one-third million dollars and is protected by about 12 million dollars in accumulated reserves. Land Bank loans for the area total 56 millions, and PCA loans 37 millions, Munger said.

### About Hybrid Cows

Recently Dr. O. E. Reed, chief of the USDA Bureau of Dairy Industry, spent a day inspecting Tom Milliman's crossbred cows at Hayfields, near Caledonia. He attended a luncheon meeting with a score of young farmers who are using some of Tom's hybrid bulls.

Dr. Reed made it clear that he had nothing against purebred cattle, and

that he looked for considerable progress to be made in bettering the breeds. At the same time he said the result of 13 years' experimentation proved the value of hybrid vigor in improving the average herd.

Dr. Reed has been criticized in dairy journals for the Bureau's report on these experiments at Beltsville. He said that only about 15 per cent of the Bureau's work with dairy cattle breeding has been devoted to the hybrids. Several of the young farmers reported on their experiences in hybridizing, and all of them said they would continue in this line.

### 'When Stomachs Are Empty'

Fred H. Sexauer, former president of the Dairymen's League, addressing the annual meeting of the Monroe County Farm and Home Bureau and 4-H Association said: "Agriculture is the foundation of freedom because freedom thrives on full stomachs. Where there is lack of freedom, there are empty stomachs and discontent."

### About Transparent Bags

When J. Raymond Shoemaker held a hearing for the State Temporary Commission on Agriculture, there was dispute about whether transparent bags containing apples should be marked as to grade. State grade enforcement officers contend they should be so marked. Complaint of some growers was that retailers may buy grade-marked apples; that if a sales clerk puts apples in a bag for a customer no additional mark is required, but that if the apples are bagged in advance of sales they become liable to closed-container regulations.

Sam Fraser urged that grade-marking requirements be required all the way through to maintain quality. Dan Dalrymple said that one chain had discontinued pre-bagging and its sales had dropped.

### MOVIES FOR FARM MEETINGS

**I**N CASE you are arranging a program or home meeting and are considering the use of a movie, we suggest that you write to Promotion Dept., Modern Talking Picture Service, Inc., 45 Rockefeller Plaza, New York 20, N. Y., and ask them for a list of pictures which they have available. The pictures are sponsored by leading American Industries and there is no charge for their use.

Just by way of examples, here are two movies available: For farm meetings or mixed groups there is the movie "The Big Kitchen"—a 25-minute colored movie sponsored by the H. J. Heinz Company which gives the story of converting the bounties of the green fields into the food that makes us strong. For homemaker audiences there is "Vera Has Her Way"—a 23-minute movie starring Vera Vague which gives numerous tips on washing machine operation. These are just two of the many movies available.

In 1932, the federal government was producing less than one-half of one per cent of all electricity generated in the United States. In 1949 this had increased to more than 13 per cent. If state and local government production is added, this figure rises to almost 20 per cent. Further, it is estimated that federal projects will account for at least 25 per cent of the new production capacity to be constructed in the United States during the next three years.

## I figured it was smart business to get set for '52 with IH 5-STAR SERVICE

**My Farmall M had a busy year.** Did a whale of a lot of work. Never gave me a bit of trouble. But I noticed during fall plowing and corn picking that it didn't have *quite* the snap it used to. Got to thinking about all the work ahead, next year—and decided I'd be smart to get a *complete* IH 5-STAR SERVICE tractor overhaul at my IH dealer's. Now I *know* I'm all set for next year. I've got that Blue Ribbon Certified Quality emblem on my tractor. To me it's like "crop insurance."

**First thing after corn picking,** my Farmall M got a pre-season inspection. My dealer's serviceman checked 24 different points. He found a number of things I knew needed attention, others I would have overlooked. We made a date to bring the tractor in for service, after getting his estimate on how much the job would cost.

**When I brought my tractor in,** my dealer's IH-trained servicemen went over it from front bolster to drawbar. They overhauled the engine, put in new spark plugs, pistons and sleeves, and adjusted the carburetor. The Lift-All unit needed service, so they reconditioned it completely—with new gaskets, seals, connections, bearings, shafts.

**The servicemen** who worked on my Farmall KNEW what they were doing. They've had special training in servicing farm tractors. The man who took my Lift-All unit apart had the right tools and equipment. He knew how to use them. Did the job a lot faster, too, than I could have. I *know* my tractor's going to perform like new, next year.

**I saw for myself** how careful the servicemen and partsmen were, to make sure every new part in my Farmall M was the *right* part. It was check and double-check, always. IH parts *always* fit right. They're precision-engineered. They're exact duplicates of the parts in my tractor when it was new. They'll help keep my M working like new, next year.

**Your McCormick Farmall tractor** has a big job to do next year. Make a date now with your International Harvester dealer for an IH 5-STAR SERVICE pre-season inspection. Let him schedule your service work now. Get IH 5-STAR SERVICE for all your McCormick farm equipment . . . to MAINTAIN BUILT-IN PERFORMANCE.

# INTERNATIONAL HARVESTER

International Harvester products pay for themselves in use—McCormick Farm Equipment and Farmall Tractors . . . Motor Trucks . . . Crawler Tractors and Power Units . . . Refrigerators and Freezers. General Office, Chicago 1, Illinois.

This New York 4-H team competed at the National Dairy Congress 4-H Club Dairy Judging Contest. Reading from left to right are: Professor H. A. Willman of Ithaca, Coach; Robert Richards and Robert Freeborn of Cazenovia; David Porter of Watertown; and Charles Anken of Holland Patent.

## 4-H'ers Take High Honors in National Dairy Competition

By H. A. WILLMAN

**F**OURTEEN 4-H cattle exhibitors most of them accompanied by their parents attended the International Dairy Exposition in Indianapolis recently where they competed with dairy cattle from 30 states and Canada.

In competition, including 520 head of cattle owned by boys and girls from 13 states and 2,800 entries in the open class show, the New York 4-H entries did themselves proud. Nine of the eleven boys and girls who entered the

fitting and showmanship contests won blue ribbons, and eight of the animals received a similar rating. A blue ribbon is the highest award possible under the Danish or group system that was employed in the Junior division of the Indianapolis Show. All of the other New York 4-H entries rated a red ribbon, none having dropped into the white and unworthy groups.

In the Junior Division of the show, the highest winner among the New York exhibitors was Silas (Bud) Stim-

### FFA WINNERS

**A**T THE recent National Convention of the Future Farmers of America, a number of northeastern Future Farmers were honored with the American Farmer Degree, the highest award which a Future Farmer can win.

Among those receiving this top degree were:

CONNECTICUT—Walter Beaton, Rockville.

DELAWARE—Richard Niblett, Bear.

MAINE—Carl Winslow, Presque Isle.

MARYLAND—Herbert Catterton, Harwood; James Pfefferkorn, Glenelg.

MASSACHUSETTS—Donald Davenport, Shelburne Falls.

NEW JERSEY—William Chafey, Mount Holly.

NEW YORK—Keith Bower, Trumansburg; Ralph Disbrow, Middleburgh; Edward Frank, Rome; Kenneth Gifford, Medusa; Wilbur Ogden, Lawrenceville, Pennsylvania; Gerald Reynolds, Corfu; Leonard Utter, Arena.

son Jr., of Spencer, who captured the grand championship on his four-year-old cow, Tottenshire Dusky Lady. Jerry Coyne and Ronald Scott however, after getting their entries into the blue ribbon group, each won first prize in their respective classes. Abigail Stimson's Ayrshire 3-year-old placed first, Sylvia Patchen of Locke had the third prize 2-year-old Holstein, and Dorothy Benedict showed the 5th prize aged Jersey cow in a very strong Jersey cow class.

Other New York exhibitors who also did remarkably well were Charles McEvoy of Homer, who entered a Holstein; Mary Kamm of Marietta and Nancy Nesbitt of Hobart with Guernseys; Laura and John Melvin of Baldwinsville and Annette Kinyon of Marietta with Jerseys, and Roger McLaughlin of Sidney Center and William Lampkin Jr. of Amsterdam with Brown Swiss calves.

To qualify for showing in the open classes, the cattle owned by boys and girls must have first placed in the blue ribbon group of their own show. Eight of the New York 4-H cattle qualified, most all of which went on to place well up in the money against the best in the adult breeders' show.

Cooperation among the New York 4-H exhibitors and parents who attended the show were excellent, and enthusiasm was high. In fact, the adventure was one of the most successful out-of-state 4-H activities conducted in recent years, and, like other trips, it will leave its mark for the betterment of 4-H work and the purebred industry. The trip was financed largely by donations from the five State purebred breed clubs, the Sears Roebuck Foundation, by premiums from State Fair, by funds provided by the 4-H exhibitors, their parents and county organizations. A supply of feed was also do-

### MYSTIC NIGHT

By Edith Shaw Butler

All bright and shining now, the tree  
Bespeaks enchantment, mystery.

It is a fragrant, jeweled thing  
With tinsel garlands glittering.

The old clock strikes, the hour is late,  
What is it that we two await?

The sound of wings, a heavenly throng  
Caroling the age-old song?

We peer out at the frosty night,  
Across the miles, the fields are white.

We lift our eyes to stars above,  
Remembering God's gift of Love.

Coyne Farms X-Ray Bell 3028343, owned by Jerry Coyne of Avon, Livingston County. This 2-year-old was 1st in the Junior Show and 5th in the open class at Indianapolis. She is a candidate for the 1951 Junior All-American contest.

nated by the Grange League Federation Exchange and the Maritime Milling Company.

A 4-H team represented New York at the International Dairy Show, 4-H Invitational Judging Contest at Indianapolis. This team won a blue ribbon under the group or Danish system, having placed eight but only 32 points below the second prize team. This team consisted of Avery Stafford of Clinton County, Philip Taylor of Erie, and Larry Bush of Greene County.

Another team, consisting of four boys, entered competition with 27 state 4-H teams on October 1 in the National Dairy Cattle Congress official 4-H contest at Waterloo, Iowa. Charles Anken of Holland Patent was high individual judge of all breeds, second on Swiss, and the team placed first on Jerseys and second on Brown Swiss and seventh on all breeds.

Tottenshire Dusky Lady 328966, owned by Silas Stimson, Jr. of Spencer, Tioga County. Dusky was Grand Champion in the International Dairy Show Junior Division. Silas held his own in a strong open class show, having won 9th with "Dusky" in one of the greatest aged cow classes ever staged by the breed. Later this cow also placed 11th in a class for the best udders.

Do You Prefer a  
Short Tube Milker?

Check These  
**NATURAL**  
**Universal**  
FEATURES

Quick, easy cleaning—and that means better control of bacteria counts. Disassembles 1-2-3.

Milks mighty fast and exceptionally dry, because of soothing, side-to-side alternating action; benefits your herd and boosts production.

Completely eliminates tipping and spillage with the exclusive balanced 2-point suspension.

The dependable UNIVERSAL Pulsator and protective low vacuum (only 10 to 12 inches) plus faster milking and easier handling are big advantages to your pocket-book and your herd.

Equipped with patented Calf-Nose Inflation and seamless stainless steel pail.

UNIVERSAL'S Hanger with 2-point suspension.

# YOU

**are the  
“forgotten man”**

**How many times have you read in the papers:**

*That YOU are getting rich?*

*That YOU charge so much for food, YOU cause inflation?*

*That YOU Drive a Cadillac?*

*That YOU are kept by the government?*

# You

**Must Do Something About It!**

There are very few of us on farms today when compared to the millions of voters there are in the whole country. This fact alone is enough to tempt politicians to pass legislation that would give government more and more control of our farms—would let government decide how much we may grow, how much we will get

for our work and products, and even what size and kind of farm we would be allowed to have. These things can happen if city, village and other non-farm people know nothing about our farming problems.

# You

**Can Do Something About It!**

As a reader of AMERICAN AGRICULTURIST, **you** know what's going on and what the truth is because you are a farmer and because your farm paper is written by men who know farming from personal experience.

But what about your non-farming friends and relatives? They read city papers and city radio programs. These carry little agricultural news but of what is carried, about 80% is harmful to you as a farmer. They write for the consumer. The consumer gets mad at the farmer—mad at **YOU!**

**They don't know** the cost of replacing a herd every 4 or 5 years. **They don't know** you get only 12c of the 25c they spend for milk.

**They don't know** apples have to be sprayed up to 27 or 28 times a year—or that you get 2c for the apple they pay 8 or 9c for.

**They don't know** what machinery you have to have or what it costs. They don't know that grass doesn't grow wild; that pastures have to be seeded, clipped and fertilized or you'll be out of business.

**They don't know** that the average industrial worker with no capital investment and no responsibilities of management makes twice as much for an hour of labor as a farmer—as you do.  
**BUT THERE IS A WAY YOU CAN TELL THEM!**

Your farm paper, the paper owned by you and other North-east farmers—the AMERICAN AGRICULTURIST—tells the story of farming—its pleasures, profits, losses, problems and headaches 24 times every year. It's written interestingly and fairly and non-farmers who read it get a new respect for farming.

We are not permitted (nor could we afford) to send the paper free—but **YOU** could help your own business by subscribing for

several of your city and village friends or business acquaintances. Let the A.A. tell **them** the farm story. Let's quit talking just to ourselves. One dollar will bring one non-farmer the A.A. for two full years—48 times they will read **YOUR** story.

**LIST THOSE YOU'D LIKE TO GET IT BELOW AND  
SEND THE LIST TO US WITH \$1 FOR EACH NAME.**

# *For Christmas Giving*

..... *if you place order right away*

**H**ERE IS a story right from the heart ..... and from much of the life of the man who brought you *Horse and Buggy Days*, *The Trouble Maker*, *Tough Sod*, *These Changing Times*, *The Destroyers*, and *The Settlers*.

**NO DRUMS** is one of the most revealing stories ever written about life at home during the Civil War period. There are battle scenes to excite the most adventurous, but much of the story is based upon the writer's own family experience.

Ed Eastman's Dad was a Civil War veteran and Ed has woven into this exciting fiction many of the true tales of adventure his father told him, though the real plot is built around the sacrifices and deeds of the women of the family during the war.

You'll hate some of the characters, and others you'll love. They are all so real and, whether hateful or lovable, are strong, rugged individualists fighting in their own way for their loved ones, their lands, and their beliefs.

**NO DRUMS** is an ideal Christmas gift that will be shared and enjoyed by the whole family. Clip the coupon below and send it in today.

## **367 COPIES Still Available**

One printing of E. R. Eastman's *The Settlers* wasn't enough to satisfy the demand last Christmas, so we made a double printing and still have a few copies left—367 to be exact.

We know that many of you who read *The Settlers* and were unable to buy the extra copies you wanted as gifts last year will be glad to know you can get them now, if you hurry. Orders for *The Settlers* for Christmas-giving will be filled in the order received.

*The Settlers* is an absorbing love story as well as the story of hardships and sacrifices of primitive living on the new farm, of death on the trail, and of some of the inglorious battles of the War of 1812.

The critics call it a "valuable contribution" and "an important addition to the epic of America."

**IF YOU MISSED "THE SETTLERS," ORDER IT NOW

# Christmas Dinner at Grandfather's

(Continued from Page 1)

kindled. Aunt Mary told us to watch the fire and put on another chunk as soon as we could. There was a pile of chunks in the wood-box, well seasoned maple or beech, too knotty to split into smaller sizes. We knew that the grownups would not disturb us in the parlor for an hour or two until the stove had thoroughly warmed two months of accumulated cold out of the room.

The parlor was large, with an organ in one corner and an old square piano in the other. We all knew exactly where to find the dominoes and tiddlywinks and were soon playing them. Grandmother had taken up the carpet late in the year and put it down again with a thin layer of straw underneath, so it had a padded, springy feel.

One of my girl cousins was always unreasonable, it seem to me, although we were inseparable. She and I had the makings of a good fight started over a tiddlywinks game when two or three uncles strolled in to get away from the congestion of women around the long diningroom table set up for this occasion in the sitting room. Occasionally one of us would adventure as far as the kitchen, but it was overflowing with aproned women with smudges of flour on their noses. We sensed that we weren't popular and retreated rapidly when Aunt Eb flourished a broom at us and shouted "skedaddle."

### A Real Dinner

By noon we were hungry, at one o'clock we were hungrier, but it was nearly two before the call for dinner came. Then we trooped out to find two diningroom tables placed end to end in order to accommodate more than twenty people. At each end of the table was a beautiful brown, shiny, fragrant hot turkey. Grandmother never bothered with soup. We started on turkey, some white and some dark meat on every plate, also baked squash, mashed potatoes and dressing—we called it stuffing. Then dishes of mashed turnip and sliced cabbage were passed around, and of course quantities of turkey gravy. Someways I always dreaded the scalloped oysters that would suddenly appear a little later, but father and mother liked them. We only had oysters two or three times a year, and they always seemed strange and outlandish to me.

It took a long time to eat, for there was much joking and talking to be done. Everybody had a second helping of turkey and dressing. Finally came time for dessert. Cousin and I were through before the rest, so I kicked her legs hard under the table just to get her attention and we both slid quietly out of the chairs and drifted back to our tiddlywinks for the time that would be needed in clearing the table. After ten or fifteen minutes, some kind of instinct told us that the time had come, so we went back to our chairs at the table.

Then came dessert. That day it was apple or mince pie—most of the men took both. Then we had black chocolate cake, but we also had a small piece of pound cake, a piece of fig layer cake, and a marble cake that some of the aunts had brought along, and after that candy, ribbon candy, French creams, motto candies, gum drops, peppermints, cinnamon drops, but no chocolate candy for some reason.

All of this time we had been well aware of the hemlock tree in one corner of the parlor loaded with packages, popcorn balls, small netting bags of candy, and decorations. Occasionally, one of the younger children tried to find the name on a particular present, but the older ones spoke sharply and drove them away. Now with dinner finished, all gathered in the parlor for the distribution of presents. Grand-

father was a sort of honorary chairman in the big arm chair and the oldest uncle took each present from the tree, called out the name in a loud voice, and handed it to one of the grandchildren for delivery. I could hear a prim:

"Thank you very much, Aunt Mary, for this pretty apron."

"Frank, go thank your grandmother for your present."

"Em, how did you know I needed socks?"

"Saw your toes sticking out the last time I was over at your house."

"Ma, look quick, see this pink hair ribbon."

"There, there, Helen, never mind, don't cry, it had to get broke some time. I'll get you another."

### Relaxation

And a dozen other bits of excited talk. Then while two or three of the women were washing dishes with help from some of the younger folks, the rest of the family all congregated around the organ. Mother was the organ player. We sang, mostly hymns, just as mother happened to find them. Grandfather and grandmother sat in their big chairs enjoying the occasion; two of the uncles and one aunt didn't sing, so sat quietly visiting; in a little while the dishwashers came in to join the chorus. I don't know why we didn't sing the popular songs of the day unless it was because grandmother didn't think them quite suitable. Mother chose the song and started it while playing the organ, the rest of us crowded as close as we could and sang at the top of our voices. Some way or other a good hour of singing on top of all that turkey seemed just right.

Before the end of the singing, cousin and I quietly left for the old back pantry to get a few more bites of turkey and chunks of cold dressing, for we were hungry again.

The horses were hitched to cutters and sleighs and we all started home. The wind had risen a little and ribbons of snow were drifting along the crust on top of the old snow. Banks were beginning to form, and just as we crossed the school-house road, Dad drove through one that was larger than he expected. Before he knew it, over went the sleigh with five folks, seats, blankets, soapstone, all in a pile. Luckily, old Tom didn't try to run away as he sometimes did. Dad hung onto the lines. The rest gathered up our belongings and climbed back in, covered with snow, faces wet, wrists wet, and generally damp, snowy and cold. But it wasn't far from home, so no one suffered.

### A Perfect Day

Funny, I don't remember much about the presents. We couldn't afford cash for many or for expensive ones, so we just made our Christmas big with turkey, games, visiting and songs. Maybe that was the best, Partner, and maybe we overdo this present giving. And maybe we do too little of the oldtime hymn singing. Some of those old songs would really stir your blood, you know. They weren't the sad, sweet, romantic songs of summer. There were the marching songs, the fighting songs, the living songs of a hard working, righteous, militant people, exultant in the fact that they had survived against wind and weather, drought and floods, Indians and wolves, and against their own sins.

Oh, yes, vitamins, Partner! Well, we probably had plenty of them, too, in that home raised, home prepared, home cooked food, but at one stage of that dinner, Partner, I'll swear you couldn't have tucked a single vitamin into my stomach. I was too full.

# BUILT-UP Litter

By L. E. WEAVER

**S**UMMER has gone and I am not ready for winter. Probably never would be if fall lasted until April. That's one of the beauties of being on a farm.

As a good friend has often said: "We don't get much out of life until we begin putting something in." I think most people are happiest when they are busiest, and I surely had a happy summer. I have even been too busy to keep up my contributions for this page.

Now that short days chase me indoors early, and cold days hold me there much of the time, I hope to do better. I have quite a store of mental notes that I would like to share with you readers.

I am beginning with some observations about built-up litter. However, you won't know what I am talking about, part of the time, unless I first explain about Mr. Head. His full name is C. Chaddock Head, and of course it's just "Chad" to his friends.

Like tens of thousands of other men, his work and life have been in town, but his dream has been to live in the country and make his living from a farm. Unlike most men with that dream, he has done something about it.

A few years ago he went into the battery broiler game in a small way, dressing the broilers at home and marketing them direct to customers in town. This summer he purchased a smallish farm with a modernized residence in a lovely valley not far from Ithaca. The former dairy barn has been converted into a thoroughly up-to-the-minute poultry plant with capacity for approximately 4,000 laying hens. That's an efficient one-man poultry plant today, provided he has a competent and interested wife, as Mrs. Head is.

## My Summer's Work

Now let's go back to my place. The last week in May I started 4,180 chicks. Eighty of these were White Cornish cockerels; the rest were straight-run White Plymouth Rocks. I did not succeed in my resolution to keep an accurate record of all deaths, but there were enough. So I was rather astonished at the number of males that survived. I sold 1,300 at one time, 275 at another, kept back at least 400 for breeder selection (including the Cornish) and sold numerous small lots for chicken dinners.

The pullets did not count up quite so well, but not too badly. After they had been vaccinated against Newcastle, immunized against Infectious Bronchitis, and blood tested for Pullorum disease, we moved about 1,850 to Mr. Head's new poultry quarters, and about 70 which failed to qualify as approved breeders under the National Poultry Improvement Plan, stayed here.

Sometime I may relate the details of the agreement between Mr. Head and myself. It is quite different. But in the short space remaining here I want to tell about the litter problem to date. It was our plan to bag up a lot of the dry, dusty built-up litter on my poultry house floors, and spread a thin layer on Mr. Head's floors before putting in new litter.

The theory for this action is that bacteria for the decomposition of new litter material, the production of vitamins, and of heat would be furnished in such abundance that all these desirable activities would begin at once and

not have to await the gradual build-up from almost no bacteria that is usual where only new litter is supplied. But at the Veterinary College they found round worms and Capillaria (hairlike round worms that resist all the usual worm expellers) in some of the pullets, so we dropped the plan of moving the old litter.

A rather generous supply of new shaving was put in, and the white birds with bright red combs looked beautiful on the clean litter. We are trying out the no-roost plan. The pullets didn't have roosts in the brooder house, and their omission in the laying house saved a lot of much-needed time.

As time passed and the litter became soiled, more shavings were added. Still they became more and more soiled, damp and packed down, in spite of the fan-driven air removal provided by the ventilation system. I should add that this problem did not exist everywhere; only in the congested "down-town" section, we might say—the area close to the water, feeders and nests, where the birds stay most of the time, including settling down at night. A change to one of the sugar cane litters has seemed to help the situation some.

At present the plan is to move wholesale lots of the moisture saturated litter to the areas around the edges of the room and replace it with the dry litter from those areas. That should work for a time at least, perhaps until the bacterial action has built up to a point where heat production will be giving a lot of help in drying out the litter.

## The "Spark Plug"

Out of this experience, I have concluded that in talking and writing about built-up litter we have emphasized only one of three important phases of the building up process. We have talked almost entirely about building up the depth of litter by adding litter material from time to time. We have merely mentioned the equally effective build-up through the constantly accumulating supply of droppings that are indistinguishable from the rest of the litter after they have become dried. And we have failed almost completely to stress the build-up of bacteria which is the very spark-plug of the whole process.

I am convinced too that we have been absolutely correct in urging that a built-up litter be started a long time before cold weather makes it necessary to close any windows. Furthermore, hereafter I shall try to keep the old litter free of the eggs of parasites and organisms of disease, so that I can use it as a "starter" to supply plenty of favorable bacteria from the beginning when readied for a new lot of layers.

# Bargaining Agency Re-elects James Young as President

THE 15th annual meeting of the Metropolitan Cooperative Milk Producers Bargaining Agency got under way with a banquet on Monday evening, December 3. The principal speaker was columnist George Sokolsky whose writings many of you read. Mr. Sokolsky told 500 guests at the banquet that Communism is not based on economic or political grounds. It is an attempt by a fanatical group to control men's actions and thoughts through fear and force.

The men in this group, the speaker said, believe in what they are trying to do, but they think entirely different than we do. To them the individual is of no importance. Whatever they can take by force and whatever means are necessary to get what they want are right.

In the long run, he said, we cannot defeat Communism by military might or political agreements. We cannot buy or bribe allies. We must convince the world that we believe in freedom based on the moral law not only for ourselves but for everyone. The speaker reminded us of the great Roman Empire which he said was conquered by a few Israelites who came to Rome without weapons or wealth!

### Resolutions:

At the business session on Tuesday, delegates by resolution stated the Agency's position on a number of matters. The 55 cooperatives representing 27,000 dairy farmers expressed vigorous opposition to the entire government price-fixing program, pointing out that price-fixing inevitably results in prices that are out of line with wages and other costs, and that are too low to maintain the volume of production needed.

They favored resistance to further extension of government controls and supervision over the private affairs of 150 million American citizens.

The delegates also approved a resolution favoring an increase in the price of Class I-A fluid milk. This resolution was introduced by Leon Chapin of North Bangor who pointed out that while the present Class I-A formula has worked well, no pricing formula can be expected to work perfectly over an extended period. He emphasized the shrinking farm labor force and rapidly expanding expenses on dairy farms as indicating the need for an increase. The resolution proposes an increase of 44 cents a cwt. for March, April, May and June.

Other resolutions gave full support to the program of Milk for Health, favored promotion of milk and dairy products for school lunch programs, and strict enforcement of laws relating to control of imitation dairy products. It opposed any change in New York

and Vermont laws to prevent the sale of yellow oleo.

### Officers:

James Young of Angelica was re-elected president as were Leon Chapin, vice president; L. J. Stammer of Gouverneur, secretary, and G. Lester DuMont of Malone, treasurer. Ernest Hartley of Osceola, Pa. was elected a director to succeed James Briggs of Westfield, Pa. Andrew Cochrane of Ripley and William Storie of Bovina Center were re-elected to the executive committee.

In his annual report President Young commented on conditions facing dairy-men as follows:

"No one dare prophesy what the next year—yes, the next month, or even the next few days may bring to us. These are strange uncertain days. We need strong leadership in all places. Above all we need to have in all places a well defined and worthy goal in mind. Let us be determined to remain free Americans. Let us stand on our own feet without leaning on government crutches."

The afternoon program consisted of a Forum on the subject "The pricing of out-of-market Class I milk." Dr. Leland Spencer of Cornell was the moderator and following the discussion he gave a summary. Taking part in the Forum were H. L. Forest, assistant director of the Production and Marketing Administration, Dairy Branch, Washington, D. C.; A. W. Colebank, market administrator, Chicago, Illinois, marketing area; H. P. Young, economist, Metropolitan Cooperative Milk Producers' Bargaining Agency, Inc., Syracuse, N. Y.; Frank B. Lent, Attorney of the Dairyman's League Cooperative Association, Inc., New York City.

—A.A.—

### REST PERIOD UPS MILK PRODUCTION 15-25%

Milk cows need a rest between lactations if they're going to do their best. Without the rest or "dry" period, milk production during the next lactation can be expected to drop from 15 to 25 per cent, according to Marvin E. Senger, University of Maryland Extension dairyman in charge of production testing.

Bossy needs 6 to 8 weeks' rest between lactations to restore the mineral content of her body, to lay some fat on her back and allow time to repair the milking tissue in her udder. Cows that are thin and heifers calving for the second time should be given at least 8 weeks "dry" period.

It is only during the last weeks of lactation and the "dry" period that cows are able to replenish the calcium and phosphorus in their bodies to meet the demands of heavy milk production.

### GATE CRASHER

This youngster got into the Eastern States Exposition without an entry fee or card because he was born right there! Mom is shown tidying him up the day after he was born. He's a new member of the Broad Place Ayrshire herd owned by Sarah C. Jones, North Amherst, Mass.

—Harold Bailey

## TINSEL-or the STAR?

By INEZ GEORGE GRIDLEY

**O**F LATE YEARS, I've tried to budget my time, effort, and enthusiasm so that I get the most fun out of Christmas, and the family profits accordingly. A last minute rush is exciting, but it's thrilling, too, to have time to enjoy the Christmas 'doings' at school and the carol singing at church. And to make a ceremony and not a chore out of trimming the house requires time and a mother who is rested and enthusiastic.

We make our Christmas greeting cards, and aren't afraid of having them all ready a month or so ahead of time. Everyone helps. Ours are a homemade adaptation of linoleum block prints. We choose a simple design, transfer it in reverse to a rectangle of ordinary kitchen linoleum, and gouge it out with a short bladed sharp knife. (Stationers have a special little tool for cutting designs on linoleum, but anything sharp may be used.) The cut-out parts are white on the finished card.

With a child's paint brush, we brush thinned oil paint over the design each time and place a piece of note paper over the block and print it. Instead of a press, we put a pad of newspapers on the floor, put the linoleum and paper on it, and step down hard, right on the back of the linoleum block. In a couple of hours we can print fifty or so, one at a time, by this primitive method.

What our cards lack in artistry, they make up in their personal touch.

A friend who moved to the city told us she missed so much going out to the woods for greens to trim the house. Our Christmas gift to her always includes a box of sweet smelling pine branches or cone-laden spruce, with some sprays of bittersweet or twigs of red berries tucked in.

I've often wished, like Robert Frost in one of his poems, that we could put a Christmas tree in an envelope and mail it to far off friends. We do invite friends in the village to pick out a tree and bring the kids along to have the fun of helping cut it.

We are partial to gifts like jars of maple butter, butternuts and hickory nuts, or a rich slab of our own homemade fruit cake.

For the last minute shopping rush, the worry over spending too much for the impressive gift, I'd like to substitute serenity and the real spirit of Christmas, so that the deeper values will have time to grow and flower.

Oh, Christ Child, have we wandered far?

This Christmas time, what shall we buy:

The tinsel, or the distant star?

**E**ACH of us, looking back, can remember one book which opened up the world of reading. It may not have been *The Water Babies*, about which Dorothy Thompson writes in *Once on Christmas* (Oxford University Press, 1938). But it may have come to us, as it came to her, as one of the treasures of Christmas.

Books belong to Christmas. And barren indeed is the stocking or tree which does not yield at least one book which holds within its covers the "lovely, lovely words of poetry," the "tales of rose-red cities half as old as time" to give children food for the mind and heart, nourishment for the imagination.

This is a year of treasure in children's books. It is good, when so much of life seems to hold problems and conflicts that hurt and destroy, to find this stronghold of truth, beauty, idealism, hope, courage and faith as strong as ever.

Along with brand new books we may consider some of the books of the past five years part of this year's treasure. For very young children, there are picture books. For the five-to-eight year olds there are picture-story books. And for the grown-up nine-to-twelves there are stories with such variety of plot and setting that every child can find the "just right" one. The starred books will be enjoyed by the entire family.

### Especially for Christmas:

*Told Under the Christmas Tree*. Association for Childhood Education. Macmillan, 1948. \$3.00. A collection of Christmas stories for family reading.

### Picture Books: (under six)

\**The Christmas Forest*, by Louise Fatio. Aladdin Books, 1950. \$1.25. What happened when Santa Claus fell asleep under a tree on Christmas Eve.

\**The Night Before Christmas*, by Clement Moore, Grosset and Dunlap, (Weisgaard) The old rhyme takes on new delight with Weisgaard's big, bright pictures.

*The Box With Red Wheels*, by Maud and Miska Petersham. Macmillan, 1949. \$1.50. A gay, warm picture book for 2 and 3 year olds. Just enough story.

*Jeanne-Marie Counts Her Sheep*, by Francoise. Scribner's, 1951. \$2.00. Delightful pictures. Jeanne-Marie has wonderful plans for Patapon's lambs. Pleasant introduction to counting.

*I Can Fly*, by Ruth Krauss, (A Little Golden Book) Simon and Schuster, 1951. 25c. Imaginative pictures and playful text. Good language experience.

### Picture-Story Books: (5-8)

*Rosa-Too-Little*, by Sue Felt, Doubleday Junior Books, 1950. \$2.00. For all the children who are too little to do the things they want to do.

\**Finders Keepers*, by Will and Nicolas. Harcourt Brace, 1951. \$2.00. A very funny story about two dogs and one bone.

*Patrick and the Golden Slippers*, by Katherine Milhaus. Scribner's, 1951. \$2.00. Gay story and beautiful pictures of the Philadelphia Mummers' Parade.

*Little Leo*, by Leo Politi. Scribner's,

**I**NSIDE the covers of books was everything, everything that exists outside in the world today. Lovely, lovely words of poetry that slipped like colored beads along a string; tales of rose-red cities half as old as time. All that men could imagine, and construct, and make others imagine."

—from *Once On Christmas*,  
by Dorothy Thompson

—Photo by Harold M. Lambert

# Books Belong with Christmas

By KATHERINE REEVES

1951. \$2.00. How all the children in an Italian village got to be Indians.

*Cow Concert*, by Earle Goodenow. Knopf, 1951. \$2.00. Imagine all the cows in a Swiss village dancing and singing and playing tunes on their bells.

### Story Books: (9-12)

\**Pippi Longstocking*, by Astrid Lindgren. Viking, 1950. \$2.00. Pippi's adventures are full of fun, nonsense, and fascinating characters.

*Giggle-Box*, selected by Phyllis Fenner. Knopf, 1950. \$2.50. "Rib-tickling" are the words for these stories.

*Steamboat South*, by Madye Lee Chastain. Harcourt, 1951. \$2.50. Amy's thrilling trip by steamboat from Ohio to Texas. Warmth and color.

\**Minn of the Mississippi*, by Holling C. Holing. Houghton, 1951. \$3.00. The history of the Mississippi. Minn is a snapping turtle who travels the river.

*Rusty at Ram's Horn Ranch*, by Shannon Garst. Abingdon, 1951. \$2.50. A good western, with a sheep raising background. Lively writing.

### All-Time Favorites

*Curious George* by H. A. Rey. Houghton, 1941. \$2.50. Curious George is a monkey who has the most delightful misadventure. (4-8)

*Millions of Cats* by Wanda Gag. Coward-McCann, 1928. \$1.75. A nonsense story with beautiful black and white pictures. (4-8)

*Little House in the Big Woods* by Laura Ingalls Wilder. Harper, 1932. \$2.00. This is the first of a group of

books about pioneer life in Wisconsin. Equally appealing to boys and girls. (6-10)

*The Matchlock Gun* by Walter Edmonds. Dodd, Mead, 1941. \$2.50. A boy defends his family from Indian attack in pioneer New York State. (10-14)

*Mary Poppins* by Pamela Travers. Harcourt, 1934. \$2.00. A nursemaid who blows in on the East Wind to give Jane and Michael many fantastic adventures. (6-10)

\**Starred books will be enjoyed by the entire family. A list of additional books, suitable for both Christmas and year-round giving, may be had by writing to Miss Reeves, c/o AMERICAN AGRICULTURIST, Box 367, Ithaca, N. Y.*

### MY GIFT

By Elaine V. Emans

Each in the way that he knew best,  
They worshipped where the loveliest  
Of babies lay: the angels, singing,  
Shepherds, bowed, and wise men bringing  
Gold to Him, and fragrant myrrh,  
And frankincense. . . And so it were  
A shabby gift, indeed, and small,  
Did I not bring Him my heart's all.

## Fashion Plus...

**No. 2523.** In this half-size shirtwaist dress, a deep front pleat provides walking ease without bulk! Three-quarter sleeves, too. Half sizes only, 14½, 16½, 18½, 20½, 22½. Size 16½, 4 yds. 39-in.

**No. 2598.** "Flattering" is the word for this princess dress with full flared skirt and soft scallop outline. Easy to make, too. Sizes 12-20, 36-46. Size 18, 4¾ yds. 35-in. Binding, 2¾ yds.

Add 25 cents for our Fall-Winter Fashion Book which has attractive pattern designs for all ages, sizes and occasions. Send to **AMERICAN AGRICULTURIST PATTERN SERVICE, Box 42, Station O, New York 11, N. Y.**

## Mrs. Learn's Chocolate Cake

ONCE A YEAR, AMERICAN AGRICULTURIST's mail is flooded with requests for a certain recipe—the one used by the winner of the New York State Grange baking contest, which this publication jointly sponsors. This year, we had no sooner announced that the winner of the 1951 Chocolate Baking Contest was Mrs. Carl Learn of Horseheads, N. Y., R.2, than the letters started to pour in. And now, here is her recipe!

It's a delicious cake, but we must admit that although we made the cake nine times in our AMERICAN AGRICULTURIST test kitchen, we did not achieve the absolutely perfect results in Mrs. Learn's prize winning cake. One word of advice about the baking: We found that we got the best results when we baked the cake on the lower rack of the oven.

## CHOCOLATE CAKE

¾ cup hot water  
½ cup cocoa  
½ cup shortening  
1¼ cup sugar  
1½ cups sifted cake flour (1 cup minus 2 tablespoons)  
1 teaspoon soda  
1 teaspoon salt  
1 cup buttermilk or sour milk (scant)  
1 teaspoon vanilla  
2 eggs

Add the hot water to the cocoa and

combine thoroughly. This will make a thick paste. Set aside to cool.

Cream together the shortening and sugar with an electric mixer at medium speed for 2 minutes (225 strokes by hand.) Add the cocoa paste and continue creaming for 1 minute (150 strokes).

Sift together the flour, soda, and salt. Add the vanilla to the milk. Add the flour and milk alternately to the creamed mixture, having the first and last additions of flour. Beat for 2 minutes (225 strokes). Add the eggs and beat for 2 minutes (225 strokes).

Pour into a 9x9x3 inches pan, which has been greased and lined with waxed paper. Bake in a moderate oven (350° degrees F.) for about 50 minutes.

The above recipe varies in one respect from the one that Mrs. Learn gave us. Hers called for 1¾ cups of flour and we found that we got better results with 1½ cups of flour. We used buttermilk in making our cake. Mrs. Learn used sour milk for her prize winning cake.

In regard to the baking, she says that she bakes her cake on the bottom shelf of her oven (an electric one, with coils top and bottom) for 35 minutes, and then moves it to the top shelf for the last 10 or 15 minutes.

## GERANIUMS

Mrs. William Jones, 49 N. Church Street, Goshen, N. Y., wants to know why an apparently healthy geranium plant does not bloom.

Although it is difficult to be sure about the answer, geraniums need to be crowded, that is, grown in rather small pots if you are going to get good bloom. If you put them in a pot where there is plenty of room, they seem to grow big tops. Eventually they will bloom but they are slow.

Also, most plant growers like to use a little bone meal in the soil in which the plant is potted, although I have had very good results where this wasn't done.

— A.A. —

## CHRISTMAS PUDDING

2 cups graham flour  
½ teaspoon soda  
½ teaspoon ginger  
1 teaspoon cinnamon  
½ teaspoon salt  
1 cup raisins  
½ cup nut meats, chopped  
1 egg, well beaten  
1 cup milk  
1 cup molasses

Thoroughly blend the flour, soda, ginger, cinnamon and salt. Add raisins and nut meats. Add milk and molasses to well beaten egg, and add this mixture to dry ingredients. Beat until smooth. Place mixture in a quart mold, and steam 2 hours. Serve hot with sauce:

## Sauce

1 cup sugar  
½ cup boiling water  
1 egg, well beaten  
1 tablespoon butter

Combine sugar and water and cook to the consistency of syrup (232° F.). Pour syrup over egg, add butter, mix thoroughly.

## SNOW ON CHRISTMAS EVE

By Anobel Armour

Softly again through feather-falling snow  
The sounds of Christmas Eve come down  
to earth,  
For there is music in the white star's  
glow,  
And angels sing again the holy birth.

There is strange beauty now on all the  
land  
And an eternal glory shining here  
Which all the faithful see and understand,  
This loveliest night of all nights in the  
year.

For fields are deep in white, and fallow  
now,  
And wind has drifted snow on pasture  
bars  
But past the orchard's topmost frozen  
bough,  
The winter sky is warm with Christmas  
stars!

*Gets consistently good results with Active Dry Yeast*

## Grange Member is Prize Cook at Cumberland County Fair

Young Kay Sheppard admires her mother's blue ribbons at their home in Cedarville, N. J. Mrs. Amy Sheppard has been winning cooking prizes for ten years now... her latest ribbons were awarded just this year at the Cumberland County Fair, where she won 2 first prizes and 1 second. Besides entering cooking contests, Mrs. Sheppard finds time to prepare special dishes for her family, and keep active in the Grange.

As a busy mother and a prize-winning cook, Mrs. Sheppard

swears by Fleischmann's Active Dry Yeast. "It's so fast and easy to use," she says. "Rises in a hurry and dissolves in almost no time."

For a festive touch at holiday meals, serve plenty of yeast-raised treats. They're so delicious—so wholesome and nourishing! When you bake at home, use yeast. And use the best—Fleischmann's Active Dry Yeast. It's fast rising, fast dissolving... so easy to use. For grand results, get Fleischmann's Active Dry Yeast.

# The Grouser

By GEORGE DUFF

(Reprinted from an old issue of the Dairymen's League News, courtesy of George C. Lee, Editor.)

**H**ARRIS WILLIAMS, the "tail sawyer," millyard teamster, and general roustabout around the sawmill and in the woods belonging to old Lemuel Garrett, was not his usual cheery self that January morning. This may have been because it was so early in the year, and consequently so close to the Christmas holidays, whose passing Harris had celebrated with vassail and song after the fashion of his Northmen ancestors. Perhaps his hair pulled, that morn of the second of January. He was silent and morose, and, when spoken to, inclined to reply shortly and in an argument-provoking manner.

Bill Bristow, the head sawyer at the mill, was also a little off plumb. He did not take kindly to Mr. Garrett's suggestion that since the pond was frozen up and there was little water to operate the mill it would be well for him to join Harris and me in an expedition to a timber lot, six miles distant up a dismal hollow and onto a wind swept hill. He considered himself as one who had graduated from the cruder toils of lumbering, and whose rightful situation was at no time distant from the shelter of the mill roof nor beyond hearing of the yawp of the six-foot circle saw.

There was, therefore, something in the way of a strained atmosphere in our little gathering on the bobsleds as we drove away to the snowy woods. We were nearly two hours in getting to our destination, and by that time our tingling nose-tips, benumbed fingers and half frozen feet rendered inoperative any desire for a plunge into the deep snows of the hemlock timberland.

"What'd the old man tell you to do?" demanded Bill as he clambered stiffly off the rear bobsled.

"Said there was about thirty logs up on the sidehill that we could dig out and skid," Harris answered, "and then if we had any time we could cut that bunch o' hemlocks by the crick and snake 'em together."

"Huh!" snorted Bill. "We'll do dummed well if we get half o' them logs skidded. Snow two feet deep, and we'll have to poke around with a handspike to find every cussed one of 'em!"

This mild profanity was indicative of an unusual dissatisfaction on Bill's part. He was a local church pillar, and rarely used stronger language than "dang," or "I'll be con-demned." Harris, quite the contrary, was at times inclined to perfervid oratory, and now as the high horse stepped on his foot while he was taking off the neck-yoke he ripped out a string of expletives that fairly hissed in the chill air.

"Nobody," he allowed, "but a blank-blanked, ripsnorted, jing-jangled old fool would send men off into the woods on a day like this! Get off'n my foot, you dash-rabbeted brute, before I bust in every blasted rib in your ram-snag-gled carcass!"

He punctuated his remarks with several applications of the neckyoke to the horse's flank, limped back and fastened the swivel clevise on the whiffletrees, hooked on a cable chain and drove the team onto the half-obliterated log road. "Cut a couple o' handspikes, Duff," he ordered, "and Bill, bring along your axe and that there peevy-bar."

"Bring along what?" said Bill.

"You heard me the first time," stated

Harris caustically. "I said for you to fetch along the peevy!"

"I suppose you mean this here cant-hook," growled Bill, shouldering the implement in question. "I wish you'd talk United States part o' the time, instead of Pennsylvania Dutch!"

That touched Harris on a sore spot. Although of clear Anglo-Saxon ancestry he had been reared in the hills of northern Pennsylvania, quite generally populated with a strain originating in the German Palatinate. He halted the team and swung round on the head sawyer as if meditating a charge. "Distress your old being," said he, or language to that effect, "if it wa'n't for your age I'd be ripsnorted if I wouldn't ram your blanked snoot into that there snowdrift!"

Bill regarded him with scorn. "You needn't bother about my age," he replied. "If you think you're man enough, just pitch in and ram ahead!"

Harris looked him over as if of half a mind to accept the invitation, but either the chill of the winter air or some recollection of legends of the head sawyer's prowess in long-gone combats acted as a dampener on his fiery spirit. He drove the team on into the woods, and we set at the task of resurrecting the logs from their snowy graves and hauling them to a skidway beside the road, from which they could be loaded on sleds. In spite of the cold and snow the skill and activity of the two lumberjacks was such that with my less effective aid they had by noon gotten nearly all the timbers off the hillside into position for loading. At noon the head sawyer kindled a huge fire by a dry pine stub, and we thawed

out the contents of our dinner buckets and took such refreshment as the situation allowed. It was during this brief rest that my companions engaged in another discussion, which was precipitated by Harris reading a news item from a piece of paper that had enclosed a section of cheese.

"There's gittin' to be quite a few of these here automobiles around in the towns," said he, "and they're havin' accidents with 'em all the time. 'Car skids and injures two,' it says here. Now what the d---l do they mean by a car's skiddin'?"

"Rear end slides around and dumps 'em," Bill informed him, "like a hind bob when it strikes a piece of sideling ice."

"That ain't skiddin'," stated Harris. "Skiddin' anything is hitching to it and snaking it along the ground, like a log to a skidway. Slewing is the word, for anything like the hind end of a load a-slidin' around into trouble."

"It's all accordin' to where you've been brought up, and whether you've learned your language by ear or by note," allowed Bill.

Harris glared at him. "Seems as if you was just huntin' trouble today," he growled. "I can't open my mouth without your buttin' in to insult me about the kind o' talk I use!"

Bill made no reply, but in the afternoon as in the forenoon there was something in the nature of an armed neutrality existing between the two. We finished hauling together the fallen timbers, and felled, cut into log lengths and skidded on the flat, three of the big hemlocks by the creek. By that time the short winter day was drawing to a close, and it was dusk when we had the load of logs on the sleds and were started out of the woods on our homeward journey. Harris drove team, as was his custom, and Bill and I sat on the rear of the load, guarding the axes and dinner pails.

"Goin' to put on one grouser, or two?" Bill demanded as we came to the top of a slope half a mile long.

"What?"

"Goin' to put on two grousers?"

"Why in Mehistopheles don't you talk so a feller can understand you? I dunno what in Gehenna you mean by

puttin' on two 'grousers'!" said Harris. He did not, of course, say Mehistopheles, nor yet Gehenna, using much shorter and more forceful expressions.

"Do ye want me to put on a grouser, or don't ye?" snarled Bill.

"Get off there and put on two rough locks, if you know enough to know what I mean," Harris commanded.

"If you want me to put on a grouser I will," Bill growled in reply. "If not, put on what you're a mind to, or go down the hill h--l a-hootin'. I can ride as fast as them horses can run!"

"I can't let go of this team to go back and chain a runner," said Harris. "They're headed for home, and they'd bolt the minute I laid the lines down. Git off there and put on some rough locks."

"Dummed if I will!" replied William.

"I'll put on the locks," I volunteered.

"I know how to do it."

"You set still, Duff," ordered the teamster. "If that old fool wants a sleigh ride by Judas Priest I'll give him one. Git-ap!"

\* \* \* \* \*

The horses settled in the collars, strained on the huge load, and it began to move. Slowly it went, over the summit of the hill, then a little faster, and a little faster and yet a little faster. Crowded irresistibly forward, the team braced, slid, broke into a stumbling trot and then into a run. Less than a third of the way down the slope the outfit was traveling, it seemed to me, with the speed of an express train. "I'm going to jump, Bill!" I shouted, and suiting the action to the word plunged into a snowdrift.

As I scrambled to my feet old Bill arose on his knees on the back of the rapidly receding load and began to fumble with an extra chain which was hooked around the top log. "Guess I better put on a grouser, hadn't I?" he shouted to the driver.

Harris did not answer, his energies being very much engaged in keeping the team from falling. Bill, the head sawyer made a short loop in the big-linked chain, crawled a little way forward on the plunging, "slewing" load, grasped the binder pole to steady himself, and leaning head downward over the side dropped the chain loop over the point of the right-hand rear runner. A shower of snow, ice particles, and even chunks of frozen mud and gravel was sprayed sidewise as the big links, pressed by the weight of the load, bit into the highway. At once the crazy speed slackened, the horses recovered their footing and began once more to surge backward, and at the bottom of the first steep pitch of the hill Harris was able to bring the outfit to a standstill.

"If I hadn't been lucky in snaring a grouser over the snout of that there bob I dunno what might 'a' happened," said Bill, addressing me as I came breathlessly up to the load.

"Yes," agreed Harris, "if Bill hadn't got that rough lock on 'em I reckon we'd have piled up in a heap before we'd gone ten rods further."

"I put on a grouser!" stated Bill.

\* \* \* \* \*

Harris' eyes narrowed, and he started to open his mouth for a caustic reply. Then a slow grin spread over his weatherbeaten countenance.

"Call 'em grousers if you want to," he said. "Call 'em anything you're a mind to, so long as you git enough of 'em on to keep me from slidin' down hill like greased lightning. Put another of your darned grousers on that nigh runner, and let's be travelin'."

"No, Harris," replied the mollified Bill, "we'll sort of compromise on it. I've got a grouser on the right runner, and I'll hold the team while you put one of your dodrotted rough locks on the left one. I guess there's a lock chain fastened on that side of the sled."

And thus equipped we resumed our homeward journey.

Welcome Home Spud

## Rochester Has Dairy Council

MILK producers and dealers in the Rochester New York area have completed the organization of a Dairy Council. They will incorporate under the name of Dairy Council of Rochester, Inc.

Ralph DeStephano of Bonny Brook Dairy was chosen as president. Oscar Smith of Livonia, and President of the Rochester Producers Bargaining Agency is vice-president of the new Dairy Council Unit. C. G. Gaylord, of the Dairymen's League is secretary, and James Bell of Blue Boy Dairy is treasurer. Other directors include Edward Miller, Ben Masseth, Leo Maciejewski and Harold Garnham representing dealers, and Ernest Strobeck, Sidney Lookup, Herbert Knop and Fred Snyder representing producers. Approximately 94% of the producers in the Rochester area and more than 80% of the dealers by volume are supporting the new Dairy Council program.

This becomes the seventh Dairy Council in New York State. The Empire State now leads the nation with one more dairy council than Ohio which is in second place with six. Other Dairy Council Units in New York State are (1) The Dairy Council of Syracuse, Inc., (2) The Dairy Council of the Capital District, Inc., (3) The Dairy Council of the Mid-Hudson Area, Inc., (4) The Dairy Council of Broome County, Inc., (5) The Dairy Council of the Elmira Area, Inc., and (6) The Dairy Council of Utica-Rome-Oneida, Inc.

## BUFFALO MILK ADVERTISING BRINGS RESULTS

IN western New York a large percentage of the milk distributors joined with 2,500 dairymen in an advertising campaign through the American Dairy Association to advertise the advantages of drinking more milk.

The campaign has been carried on through ads in city and town newspapers, bus cards, outdoor bill boards, direct mail, and radio and television. The theme of the advertising has been "Drink Milk for Refreshment."

It is always helpful to get some measure of results, and in this case figures have been collected on fluid milk sales (this year and last) in the Buffalo area where the campaign was conducted, and also in the Rochester area where there was no milk advertising campaign. Here are some of the figures compared to last year:

	BUFFALO	ROCHESTER
July	up 4.4 %	up 1.92%
August	up 4.31%	up 1.46%
September	up 4.3 %	up 2.85%

Because of this fine showing, the milk producers and distributors have authorized a continuance of the advertising program for another six months.

— A.A. —

## NEW LIVER FLUKE

A new liver fluke disease is a threat to New York State dairy cows and sheep. The bad news was first told by the New York State College of Veterinary Medicine where this new parasite has been studied for some time. The fluke is a small worm about one-half inch long which lives in sheep and cattle livers and makes the animals sick. It also renders the livers unfit for food and thereby causes a considerable loss.

The parasite, well established in at least 6 central New York counties, was first reported near Homer in 1941. So far no control has been found although research has discovered that woodchucks are also affected and spread the parasite. Research, of course, will be continued.

## On Matters Affecting Today's Dairymen

### Local Annual Meetings Offer Dairymen's League Members Opportunity to Suggest, Improve, Criticize, and to Elect Officers of Their Choice to Carry Out Policies in 1952

The Dairymen's League Co-operative Association is a business democracy . . . a co-operative effort of farmers, by farmers, for farmers. That means every member has a voice in policies, practices, management and administration. It means that every member should use that privilege . . . should make his voice and his opinions heard . . . and should register his vote for the officers who will manage his Local, and who may—as so many Local officers have—move up to positions of Association management as a Director or elected officer.

### Now is the Critical Hour

Never in recent memory have dairy farmers faced such complex and difficult marketing problems . . . such staggering costs for everything they use and buy . . . so many cramping controls and regulations . . . and such a disheartening burden of taxes. Worried, harassed and frustrated by all of these factors, every member must have questions to ask or suggestions to offer. The give-and-take of honest debate will help each member to resolve his own doubts and anxieties, to clear the air, and possibly to make a worthwhile contribution to solving some troublesome problem.

### Attending the Meeting is the First Step

No worthwhile job is ever done, no contribution to the common welfare is ever made, by sitting back and letting the other fellow do the hard work. That's just like the citizen who never votes in a town, state or national election, and then blames the politicians for not doing as he would like to have them do. True citizenship begins at the grass roots level, whether it be citizenship in a nation, or citizenship in a co-operative farm organization. So, those who enjoy the privileges of Dairymen's League membership owe it to themselves and to their neighbors to attend their Local's Annual Meeting and join in the discussion and voting. In total, 625 Local Annual Meetings will be held throughout the 24 Districts of the Association. That means that every member has the opportunity with only a minimum of travel and inconvenience, to be present and to make his views heard.

His Local's officers and the mail will tell him when his Annual Meeting will be held. It is an important date. League members should resolve now to be present, to take part, in short, to take advantage of their privilege as active and influential members of the

# KERNELS, SCREENINGS and CHAFF

## SUNNYGABLES NOTES

By John B. Babcock

**A** MAN raised on a Nebraska farm recently told me that his family used to burn ear corn to heat the house years ago. Somehow I couldn't imagine a farmer tossing plump ears of corn into the kitchen stove. I asked how this apparently wasteful practice came about. "It was simple," my friend told me. "On the basis of heat returned, corn was cheaper to burn than coal or wood. Nebraska has easy access neither to coal nor wood, situated as she is without forests or coal mines. In those days of low corn prices, cribbed corn was the cheapest fuel we could find."

Startling as this practice seems to a Northeasterner, it does point up an interesting side of crop harvest and storage. Actually, the measure of our winter's feed supply depends on how many calories we store to provide energy and warmth for our growing and producing livestock. Because our part of the country is short on grain, we attempt to store these calories and equally important proteins in the form of grass silage and hay.

Then, to save an even greater proportion of the feeding value of hay, some of us are doing the opposite from the Nebraska farmer who burned corn in the stove to gain calories to heat the house—we burn oil, coal or wood, and with forced ventilation, use the calories from these fuels to safeguard and protect additional energy in the hay that goes into our barn curing systems. In the West, farmers similarly burn oil in drying systems to save the 30 per cent or more of calories lost in corn that is cribbed without heated air drying. In other words, we exchange the energy of cheap fuels to save more of the energy of valuable feeds.

Beyond being merely an interesting observation of the economics of energy, perhaps the above serves to give us a basis for seeking a method of storing feed in the future which will save the greatest amount of feed energy with the least cost for energy in the form of heat, power to drive equipment, or human labor.

We can be sure when ensiling grain and forage crops that the energy loss brought about by the practice is a small and constant percentage if the job is done correctly. As long as we control or minimize the energy put out in the form of power equipment and labor, are we not, by making silage, gaining more energy for less output than by other storage methods?

### SOUND HERD BUILDING

At SunnYGables, Jack is paying as much or more attention to his young stock than to his milking herd. We recognize that a cow will produce no better than her inherited ability attained by carefully selecting the cow and bull. Similarly, we recognize that

an animal (which by careful feeding can double its weight at first every few weeks, and later every few months) can have its future productive life handicapped by a poor start.

### Calves on Whole Milk and Wire

Though it is a matter of controversy, and we by no means have made up our minds that we are 100 per cent right, the Brown Swiss calves are getting their start on whole milk. I am convinced, as Jack is, that milk substitutes will raise fully as good a calf as whole milk, but somehow feel that more careful management is needed.

Jack's calf losses and setbacks last year were due in large part to drafty living quarters. Every effort is being made this season to give them the best spot in the barns, and feeding almost a can of whole milk a day may be an unnecessary added precaution or an unwarranted expense during the high milk price season. Nevertheless, that is the feeding program struck on for this season. It might also be noted that Jack is in a favorable position to use whole milk since he has some cows that work out better as nurse cows than as members of the milking string.

Wire is another "must" that we are following this season—not in the feed ration, of course, but as part of the housing program. Small stalls are equipped with bedded wire mesh which keeps the small calves a few inches off the floor. Calves definitely do better than those raised on bedded concrete. A fraction of the bedding is required to keep calves warm and dry on wire. Excess moisture drains down through the wire and evaporates from the floor. Building wire platforms is an added chore, but one that we are sure will pay back many times.

### Segregating Age Classes

Anyone who started school ahead of his age will remember the shoving around the older boys handed out to the smaller members of the class. I think growing calves have the same feeling when they are forced to compete with hungry stall mates which outweigh them two to one. For that reason Jack's small calves are started alone or in pairs, and as they increase in size, graduated from one size and weight pen to the next.

No one stall has over two or three individuals until the animals reach about a year of age. Then they are run in a large pen where they must adjust themselves to the rules of society that they must live under the rest of their lives in the loose pen stable. By starting young, but at an age where size and vigor are about the same throughout the pen, the heifer either learns how to get along with others, or marks herself as one of those occasional timid animals that just never will prosper in a pen stable. If she proves to be this type of animal, she can be weeded out before she has cost too much to grow.

### Who Is Boss?

Every cow in a pen sooner or later shakes down into her proper position of rank. There is always a boss cow, and always one at the bottom of the heap which is buffeted around by all the others. This less-bold cow may

make up for brawn with brains in getting plenty to eat and a good place to lie down. Occasionally you will observe one cow challenging another for rank in the herd, just as a new cow has to try every cow in the barn to find out just where her bluff is called.

The easiest way to observe the chain of command in the barn is to watch the order in which cows walk in to the stable at milking time—particularly where grain is fed in the parlor. Fortunately, the order in which they crowd into the parlor is not the order in which they produce. I understand that studies are being made at experiment stations to see whether there are any psychological effects from the order of rank in a group of animals. I have heard that where male hormones are injected into a timid chicken, and she aggressively assumes command of the whole flock, the previous top kick in the poultry house sulks and is maladjusted for days.

### A NEW MACHINERY PROBLEM

Feeding long grass silage from a wagon on a paved floor is a handy and easy way to take care of the biggest feeding chore in the dairy. The practice has brought out one new problem, however, that we did not foresee. As manure accumulates on the paved area, it is scraped from the floor with a blade on the tractor into a spreader spotted below a lip run out from the feeding area. We find that the small amount of silage pulled from the wagon and mixed with manure does not spread very well. Where a good spreader tears up and spreads long hay or straw mixed with manure, the extra strands of ensiled grass tend to wind rather than tear into pieces suitable for spreading.

### BOOTS FEEDING YOUNGSTOCK

In addition to some foundation dairy stock, Boots is stuffing grass silage into a bunch of young dairy-type steers and heifers that will be marketed for beef. In this way, he will empty his silo and barn of roughage with no expense for grain, and make good use of the feed put up for the dairy that was sold last summer. Boots considered selling some feed, but finally figured the cheapest way to market good forage is through animals.

Next spring, we will take a look at the growing animals and the market. We will either carry the youngstock over on pasture next summer, or market them if price is right and weight gain justifies selling.

**T**HE roof put over our trench silo this year was a precaution against water entering the silo and causing the spoilage suffered last year. It served its purpose well, and is producing another dividend this winter—the trench is about as pleasant a place to work in cold weather as there is on the farm. In fact, the area under the roof is so pleasant that Jack's dog, Peg, spends a good part of her sleeping time in a den on top of the silage pack. Jack feels sure he feeds his herd in much less time than he would from a tower silo, and is glad not to have the hazardous climb to the top every day.

Some things to note in this photo: 1. The silage has settled from a height of five feet above the top of the concrete wall to three or four feet below. 2. Apparently, sloping walls in a trench do not help packing at all. The white line shows how packing and settling

have brought the formerly heaped center below level, and indicates that the material on the sides went down scarcely at all. This could mean that sloping walls prevented good packing. We are considering pouring the other wall of the trench straight up and down so we can observe the difference. Light and dark streaks show different types of materials dumped in trench from day to day, field to field. 3. Jack uses a hay knife for most of his cutting since silage was put in late, did not pack hard enough in most places to bother starting up the chain saw. Chain saw still is a necessity where packing is hard. 4. Spoilage at top is not heavy—four to six inches. 5. Jack stands on feed trailer which is backed where desired for easy loading. 6. Most of scrap lumber roof can be recovered and used again, though new paper must be purchased. Removable sections will be final solution.

## Cattle Rustling Reward Extended

**I**N THE July 21 issue we offered a reward for jailing cattle thieves. The offer, details of which are given in the reproduction of the poster at the right, is still in effect, and the expiration date has been moved ahead to December 31, 1952.

We did this because cattle rustling is still altogether too common. Unworkable price controls and resulting black markets had their effect, but the value of cows for meat and the difficulty of identifying a stolen cow once she has been slaughtered have encouraged rustlers. Prompt arrest and convictions and stiff penalties are the best cures!

The only requirements not mentioned in the poster are that a subscriber from whom cattle are stolen must have an AMERICAN AGRICULTURIST Service Bureau sign posted at the time of the theft, and the claim for the reward must be made before or immediately following the conviction of the thief.

Since the reward offer was made, two \$100 checks have been sent, one to Ward Tiffany, Route 2, Unadilla, N. Y., and one to Mrs. Mabel Clancy, Middle Grove, N. Y., whose story appears on this page. Another check will go out soon and we will tell you the details in a future issue.

This reward is offered to discourage cattle rustling and to bring cattle thieves to justice. As an AMERICAN AGRICULTURIST subscriber you can help by notifying law enforcement officials immediately, by giving them all available information, and by recording li-

cense numbers of any strange cars you see loitering in your neighborhood.

Investigate any one who offers to sell a cow at a "bargain"; also check on any cow which shows that her ear tag has been tampered with. Working together, we trust that AMERICAN AGRICULTURIST, our subscribers, and the law enforcement agencies can keep cattle rustling in check.

## She Got a \$100 Check!

**I**T ALL began when some people went mushroom hunting on the property of Mr. and Mrs. William Clancy of Middle Grove, N. Y. In a wooded area, these folks found a calf chained to a tree. They reported this to the Clancys, who owned no livestock. On their way to investigate, our subscribers noticed a car parked along a dirt road. When they reached the spot where the calf had been, it was gone; but they did find a man's jacket.

Since they had no phone, Mr. and Mrs. Clancy took their story to Constable Lester Enos of Galway, N. Y., and he called the State Police at Saratoga. This was on July 15. There had been no reported thefts of cattle in the immediate area, but the State Police did know of a stolen calf which had been taken from the pasture of Frederick Krappman, Route 2, Saratoga Springs, the previous night. With that in mind, they launched their investigation.

The Troopers again interviewed Constable Enos on July 19, and he told them of a Robert Mulligan of Ballston Springs who had been trying to sell a calf in that area. Mulligan was questioned, and finally admitted stealing the calf and chaining it to the tree. However, he claimed that when he re-

turned for it, it was gone. The animal was later found on the farm of John Nichols of Saratoga Springs, where it apparently had wandered after working loose from the chain. It was returned to Mr. Krappman.

Mulligan was charged with petit larceny, pleaded guilty, and was sentenced to 60 days in Saratoga County Jail by Judge Michael E. Sweeney of Saratoga City Court.

Mrs. Clancy applied for the reward, and careful investigation showed she was eligible. Her Christmas shopping problems should be greatly diminished by the \$100 check we have mailed to her. Our congratulations go to her and to the authorities who did such a good job of sending another cattle rustler to jail.

### CAN YOU HELP US?

We would like to get in touch with Edward Hubbard, formerly of W. Third St., Corning, N. Y. We understand he may now be living in Rochester. If anyone knows the present address of this man, we will appreciate having it; or if Mr. Hubbard should see this item, we will be very glad to hear from him. Address AMERICAN AGRICULTURIST, Box 367-H, Ithaca, N. Y.

# SALUTE TO YOUNG FARMERS

Forty-seven boys and girls from New York State and New England were among several hundred rural youngsters in forty-two states winning honors in the 1951 Production-Marketing Contest of the National Junior Vegetable Growers Association.

Winners were announced December 13, at the closing session of the NJVGA convention in Cleveland, O.

Object of the contest is to encourage farm boys and girls to learn modern, efficient methods of growing and marketing vegetables, to the end that growers of the future will be prosperous and consumers will be well fed.

Standards of the contest are high. Many boys and girls proved they can not only equal the performance of seasoned growers but add improvements of their own.

A & P and the Atlantic Commission Company have sponsored these annual NJVGA competitions for 11 years. It has been our privilege to award scholarships to help these youngsters continue their agricultural education or to broaden and improve their production projects.

To the rural families that have reared these boys and girls to be the fine farmers and citizens they are, go our sincerest congratulations. The heritage they pass on is reassurance that America will continue to be the best fed nation on earth.
